Board Cover Memorandum

To Board of Education

From Kyla Johnson-Trammell, Superintendent
Tadashi Nakadegawa, Deputy Chief of Facilities Planning & Management

Meeting Date June 29, 2022

Subject Resolution No. 2122-0237 - Adopting a Mitigated Negative Declaration for the Cole Administrative/Education Center Project

---

Ask of the Board Hold a public hearing and approve Resolution No. 2122-0237 - Adopting a Mitigated Negative Declaration for the Cole Administrative/Education Center Project

Background The Board previously approved Resolution No. 1819-0211 (Authorization to Move Forward with the permanent housing at a rehabilitated Cole as the Administrative Center of the District. And, authorization to approve the interim housing location at 1000 Broadway. Finally to authorize the revision of the Measure J spending plan to show how the current bond will fund the initial planning phase of the permanent housing and the updated rent costs for interim housing.), which rescinded prior resolutions and approved a proposal to rehabilitate the Cole Campus (1011 Union St, Oakland, CA 94607) as the District's Administrative Center ("Cole Project"). The Cole Project has advanced to the stage where an Initial Study is required under CEQA and the Initial Study (including the Mitigated Negative Declaration) in now complete.

Discussion Under the proposed Resolution, the Board would make a number of findings:

- The required public hearing was duly noticed and properly held.
- The Initial Study/Mitigated Negative Declaration was presented to the Board.
- The Initial Study/Mitigated Negative Declaration has been completed in compliance with CEQA.
- The Board has reviewed and considered the information contained in the Initial Study/Mitigated Negative Declaration and the comments received before and during the public review process.

Additionally, under the proposed Resolution the Board officially would adopt the Initial Study/Mitigated Negative Declaration, approve the Cole Project, and authorize the Superintendent to take all steps necessary to proceed with the Cole Project.

Fiscal Impact This Resolution does not directly have a fiscal impact as the cost of the Cole Project was already approved by the Board and incorporated into the Measure Y Spending Plan. However, by proceeding with the Cole Project, the District will continue to incurr

the budgeted costs and may be asked to incur additional costs due to inflation costs or if the Cole Project is delayed.

Attachment

- Resolution No. 2122-0237 - Adopting a Mitigated Negative Declaration for the Cole Administrative/Education Center Project

RESOLUTION OF THE
BOARD OF EDUCATION OF THE
OAKLAND UNIFIED SCHOOL DISTRICT

Resolution No. 2122-0237

Adopting a Mitigated Negative Declaration for the Cole Administrative/Education Center Project

WHEREAS, on or about June 5, 2019, the Board approved Resolution No. 1819-0211 (Authorization to Move Forward with the permanent housing at a rehabilitated Cole as the Administrative Center of the District. And, authorization to approve the interim housing location at 1000 Broadway. Finally to authorize the revision of the Measure J spending plan to show how the current bond will fund the initial planning phase of the permanent housing and the updated rent costs for interim housing.), which rescinded prior resolutions and approved a proposal to rehabilitate the Cole Campus (1011 Union St, Oakland, CA 94607) as the District's Administrative Center ("Cole Project") and to remain at 1000 Broadway as interim administrative housing until the Cole Project is complete;

WHEREAS, on April 14, 2021, the Board approved the initial Measure Y spending plan, which included allocated $50 million for the Cole Project;

WHEREAS, on June 23, 2021, the Board approved Resolution No. 2021-0168 (Resolution No. 2021-0168 - Identifying Baby Cole as the Plan for Permanent Central Office Housing and Restarting All Associated Planning, Bidding, and Construction Activities), which "reaffirm[ed] its intent to build permanent Central Office housing at the Cole campus" and "direct[ed] the Superintendent to restart—as quickly as possible—all planning, bidding, and construction activities related to Resolution No. 1819-0221";

WHEREAS, the Cole Project has advanced to the stage where an Initial Study is required under CEQA; and

WHEREAS, the Initial Study (including the Mitigated Negative Declaration) has been completed, is attached hereto, and is incorporated herein by referenced.

NOW, THEREFORE, BE IT RESOLVED, the Board finds that the required public hearing was duly noticed and properly held, the Initial Study/Mitigated Negative Declaration was presented to the Board, the Initial Study/Mitigated Negative Declaration has been completed in compliance with CEQA, and the Board has reviewed and considered the information contained in the Initial Study/Mitigated Negative Declaration and the comments received before and during the public review process;

BE IT FURTHER RESOLVED, the Board hereby adopts the Initial Study/Mitigated Negative Declaration for the Cole Project; and

BE IT FURTHER RESOLVED, the Board hereby approves the Cole Project as identified and evaluated in the Mitigated Negative Declaration and authorizes the Superintendent, or her designee, to take all steps necessary to proceed with the Cole Project, except any further actions by law, rule, or regulation that are the province of the Board, and that such steps include but are not limited to filing any notices permitted or required under CEQA for the Cole Project to move forward.

PASSED AND ADOPTED by the Board of Education of the Oakland Unified School District this 29th day of June, 2022, by the following vote:

PREFERENTIAL AYE: None

PREFERENTIAL NOE: None

PREFERENTIAL ABSTENTION: None

PREFERENTIAL RECUSE: None

AYES: Aimee Eng, VanCedric Williams, Clifford Thompson, Vice President Benjamin "Sam" Davis, President Gary Yee

NOES: None

ABSTAINED: None

RECUSED: None

ABSENT: (Vacancy), Samantha Pal (Student Director), Natalie Gallegos Chavez (Student Director)

CERTIFICATION

We hereby certify that the foregoing is a full, true and correct copy of a Resolution passed at the Meeting of the Board of Education of the Oakland Unified School District held on June 29, 2022.

Introduction

This document serves as the Initial Study for the Oakland Unified School District Central Administrative/Education Center at Cole Campus Project (Project). Per CEQA Guidelines Section 15063, following preliminary review, the Lead Agency shall conduct an Initial Study to determine if the project may have a significant impact on the environment. The purposes of an Initial Study are to provide the Lead Agency with information to use as the basis for deciding whether to prepare an Environmental Impact Report (EIR) or a Negative Declaration. The Initial Study is also used to enable the project applicant or the Lead Agency to modify a project, mitigating adverse impacts before an EIR is prepared, thereby enabling the project to qualify for a Negative Declaration. An Initial Study can also serve to focus the EIR on the effects determined to be significant, identifying the effects determined not to be significant and for other reasons.

This document is organized in three sections as follows:

- **Introduction and Project Description:** This section introduces the document and discusses the project description including location, setting, and specifics of the lead agency and contacts.
- **Initial Study:** This section discusses the CEQA environmental topics and checklist questions and identifies the potential for impacts and proposed mitigation measures to avoid these impacts.
- **Mitigated Negative Declaration**: This section includes the CEQA Findings, which conclude that although the Project could have a significant effect on the environment, there will not be a significant effect in this case because mitigation measures to reduce these impacts will be required of the project. Pursuant to CEQA Guidelines Section 15071 (e), this section also includes a list of all mitigation measures required of the Project to avoid potentially significant effects. These measures have been agreed to by the District (as both applicant and lead agency), and would avoid or mitigate the effects of the Project to a point where clearly no significant effects (as defined by CEQA) would occur.

Project Information

1. Project Title: Cole Administrative / Education Center Project
Oakland Unified School District Project # 19119

2. Lead Agency Name and Address: Oakland Unified School District
955 High Street
Oakland, CA 94601

3. Contact Person and Phone Number: Kenya Chatman, Executive Director of Facilities
510.535.7050
kenya.chatman@ousd.org

4. Project Location: 1011 Union Street
Oakland, CA
Assessor's Parcel No. 004-0053-007

5. Project Sponsor's Name and Address: Oakland Unified School District
Facilities Planning and Management Department
955 High Street
Oakland, CA 94601

6. Existing General Plan Designations: Urban Residential

7. Existing Zoning: Urban Residential-2 (RU-2)

8. Approvals needed from Public Agencies

The Division of the State Architect (DSA) within the California Department of General Services has jurisdiction over and regulation of construction activities by public school districts in California. Therefore, development of the Project would require demolition, grading and building permits issued by the Division of the State Architect.

Land use and zoning jurisdiction rests with the City of Oakland. As a partially non-educational building (i.e., OUSD administrative staff occupancy), the Project would require Design Review approval and potentially a Conditional Use Permit from the City of Oakland.

The Brownfields Restoration and School Evaluation Branch of the California Department of Substances Control (DTSC) has established protocols for site evaluation and cleanup. Pursuant to this process, remaining steps include, but are not limited to approval and acceptance of a final Preliminary Environmental Assessment, entering into a subsequent Voluntary Cleanup Agreement or School Cleanup Agreement, and preparation of a Removal Action Work Plan or Remedial Action Plan, including providing additional opportunities for public comment. Following that approval, the District will be responsible for conducting all necessary cleanup activities pursuant to an approved Removal Action Work Plan or Remedial Action Plan and obtaining a "No Further Action" letter from DTSC, once all cleanup activities are satisfactorily completed under DTSC oversight,

9. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code §21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Pursuant to Public Resources Code §21080.3.1, the California Native American tribes traditionally and culturally affiliated with the project area have been contacted to inform them of the project, and to provide an opportunity to request further consultation. To date, no tribes have requested consultation pursuant to Public Resources Code §21083.3.2.

Project Description

Background

The Oakland Unified School District's (OUSD, or District) primary administrative functions were formerly located at the District's Administration Building at 1025 2nd Avenue in Oakland, along the Estuary channel south of Lake Merritt and north of Laney College. In 2013, a substantial water leak occurred on the top floor of this building, causing excessive damage to the entire structure. As a result, the Administrative Building was vacated, and District staff members were relocated to numerous other locations including the Cole Middle School, Lakeview Elementary School, Tilden Elementary, and 2111 International Boulevard, while the District assessed its long-term options for permanent replacement space for these administrative functions. Currently, the majority of the District's core administrative functions and staff have been consolidated in leased space at 1000 Broadway in downtown Oakland, and the OUSD Board of Education meets in Chamber at the Great Room of La Escuelita K-8 community school at 1050 2nd Avenue, adjacent to the former Administration Building.

The District Board of Education directed the District's Facilities Department to analyze various long-term options to accommodate these core administrative functions, other than under a continued lease at 1000 Broadway. The Facilities Department identified a number of potential locations for a new, permanent location for these core administrative functions, and four primary options were seen as most viable as a permanent location:

- using other existing but underutilized District facilities throughout Oakland, as a non-centralized administrative approach
- leasing an alternative, less expensive building near the Oakland Airport
- rehabilitating the District's prior building space at 1025 2nd Avenue, and
- building a new Administrative Center by redeveloping the Cole Middle School Campus in West Oakland

Ultimately, the Facilities Department recommended rebuilding the Cole Campus as a permanent home for the District's core administrative functions. The three primary advantages of rebuilding the Cole property are:

- rebuilding at Cole was found to be less expense than rehabilitating the former building at 1025 2nd Avenue,
- the Cole property is currently in OUSD ownership and would not require leasing from a third party, and
- the Cole property is large enough to reunify the District's core administrative functions in a centralized location, allowing for more efficient operations

The District's Board of Education agreed with the Facilities Department's recommendation, and selected the Districts' Cole Campus property at 10th Street and Union Street in West Oakland as the preferred permanent site for the District's core administrative functions. With voter approval of the November 2020 School Bond Measure, the District now has funds to begin implementation of this Project, known as the Cole Administrative/Education Center (i.e., the Project).

Project Location

The Project site is located at the former Cole Middle School campus in the Acorn neighborhood of West Oakland (see **Figure 1**). This site occupies the entire block bounded by Union Street to the east, 10th Street to the south, and Poplar Street to the west, and has a street address of 1011 Union Street. At this location, 12th Street is discontinued for the 1-block segment north of the site, such that the Project site is immediately adjacent to Wade Johnson Park to the north. The Project site is approximately midway between Mandela Parkway (two blocks to the west) and Adeline Street (two blocks to the east).

Surrounding the Project site is a mix of land use types include Wade Johnson Park to the immediate north, the Oakland Housing Authority's West District offices to the immediate south, single-family residential homes to the east, and attached low-rise apartments of the Peralta Villa public housing community (owned and operated by the Oakland Housing Authority) to the west. Lowell Park and the adjoining West Oakland Middle School are several blocks to the east between Adeline Street and Market Street, and industrial and light-industrial land uses line 14th Street from Mandela Parkway to Union Street (a full block to the north).

Regional access to the site is provided by the I-880 and I-980 freeways, the Bay Area Rapid Transit District's (BART) West Oakland station, which is less than one-half mile walk to the southwest, and AC Transit bus lines that run along Adeline Street, 10th Street and 14th Street. Vehicles can access the site from multiple routes from I-880, via Union Street from the south or West Grand Avenue to Adeline from the north. Vehicles can access the site from I-980 to the east via either 14th Street or 12th Street. Mandela Parkway is a regional connector road only 2 blocks to the east, connecting between the West Oakland BART station and the City of Emeryville. The primary AC Transit routes serving the site include:[1]

- Route 29, providing service between Emeryville and Lakeshore Avenue, with stops at the West Oakland BART station and the City Center BART station, and a stop at the Project site's corner of 10th and Union Streets, generally running with headways of every 30 minutes throughout the day
- Route 14, providing service between the West Oakland BART station and the Fruitvale BART station, with a stop just one block to the north of the Project site at 14th Street and Poplar, generally running on 15 to 20-minute headways throughout the day, and
- Route 36, providing service between downtown Berkeley and the West Oakland BART station, with a stop 2 blocks to the east of the Project site at 10th and Adeline, generally running with headways of every 30 minutes throughout the day

Dedicated bike lanes exist on Mandela Parkway to the west, on 8th Street to the south, and 14th Street from Kirkham Street to Market Street to the north. Buffered bike lanes exist on Adeline Street from 10th to 19th Street to the east.[2]

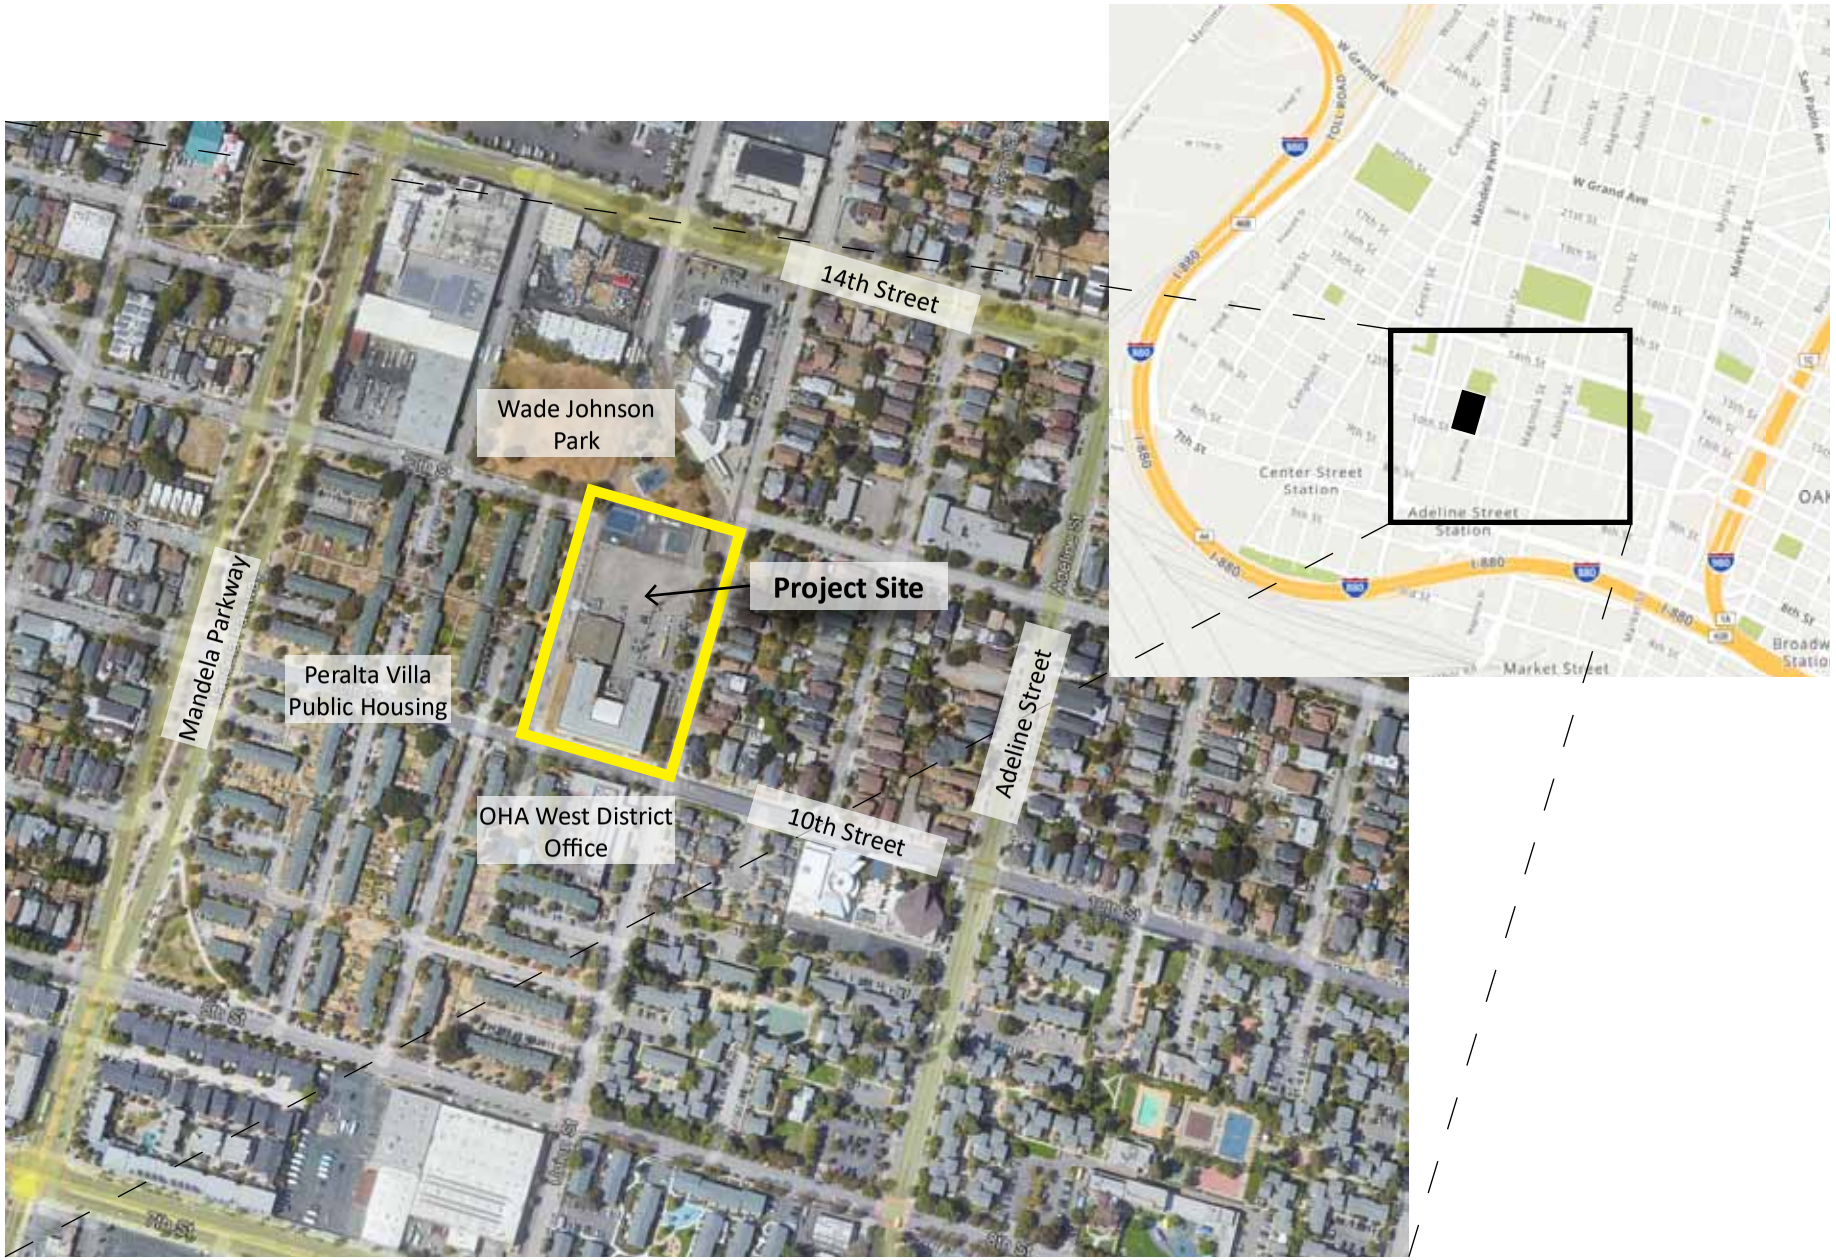

Figure 1
Project Site Location

Existing Conditions at the Site

The Project site consists of a 2.6-acre property located at 1011 Union Street in West Oakland, (Assessor's Parcel No. 004-0053-007). Three buildings formerly occupied the site (see **Figure 2**). The Cole Middle School classroom building, located at the south end of the site with its primary façade fronting Union Street remains. The Cafeteria building, which was located northwest of the Cole Middle Schools' west wing, with its west façade fronting Poplar Street; and a wood-frame modular building that was located at the far northeast corner of the site, have recently been removed (as of early 2022).

- The Cole Middle School building is a two-story, U-plan building of approximately 44,000 square feet. The Cole building was originally constructed in 1925 and designed in the Gothic Revival style, but was later renovated and restyled in 1936, resulting in its current Moderne aesthetic,[3] (see **Figure 3**). The building was originally used as an elementary or grammar school, and was converted to a middle school in 1980. Traditional middle school academic activities at the Cole Middle School ended in 2009 due to declining enrollment, and students were reassigned to other middle schools in the District. Since 2009, the Cole building had been used (until recently) for several different OUSD staff and functional groups, including the OUSD Police Department (which has since been defunded at the end of 2020), the OUSD Special Education staff and Special Education classes (which has been relocated to another OUSD school site in 2021). The OUSD Data Center (the Data Center houses computer servers, electronic data storage, and related devices for the District) will remain operational until its relocation to the new Administrative /Education Center building pursuant to the Project).
- The Cafeteria building was built in 1949 and was situated immediately north of the west wing of the Cole Middle School building. This one-story building had a rectangular footprint of approximately 6,400 square feet and a moderately pitched gabled roof (see also **Figure 3**). The Cafeteria building was originally designed to house a student cafeteria and the school's music program, and had one additional classroom. The Cafeteria building was demolished in early 2022.
- The small modular building at the northeast corner of the site was erected in 2011, and previously served as a small storage area for the District. The modular building was removed in early 2022.

The remainder of the Project site was originally used as hard-surfaced outdoor play space when the campus was functioning as a middle school, and had (until recently) been used as vehicle parking for District staff (parking lots that were used by OUSD and the OUSD's Police Unit are divided by a chain-link fence). The frontage of the Cole building to the southeast, south, and west is planted with grass. A fenced enclosure surrounds HVAC equipment at the southeast corner of the Cole School. To the north, several raised planting beds and movable planters occupy the portion of the site immediately east of the Cole building. Currently, the Cole Middle School building is essentially unused, other than on-going operation of the Data Center.

General Plan and Zoning Designations

General Plan Land Use Designation

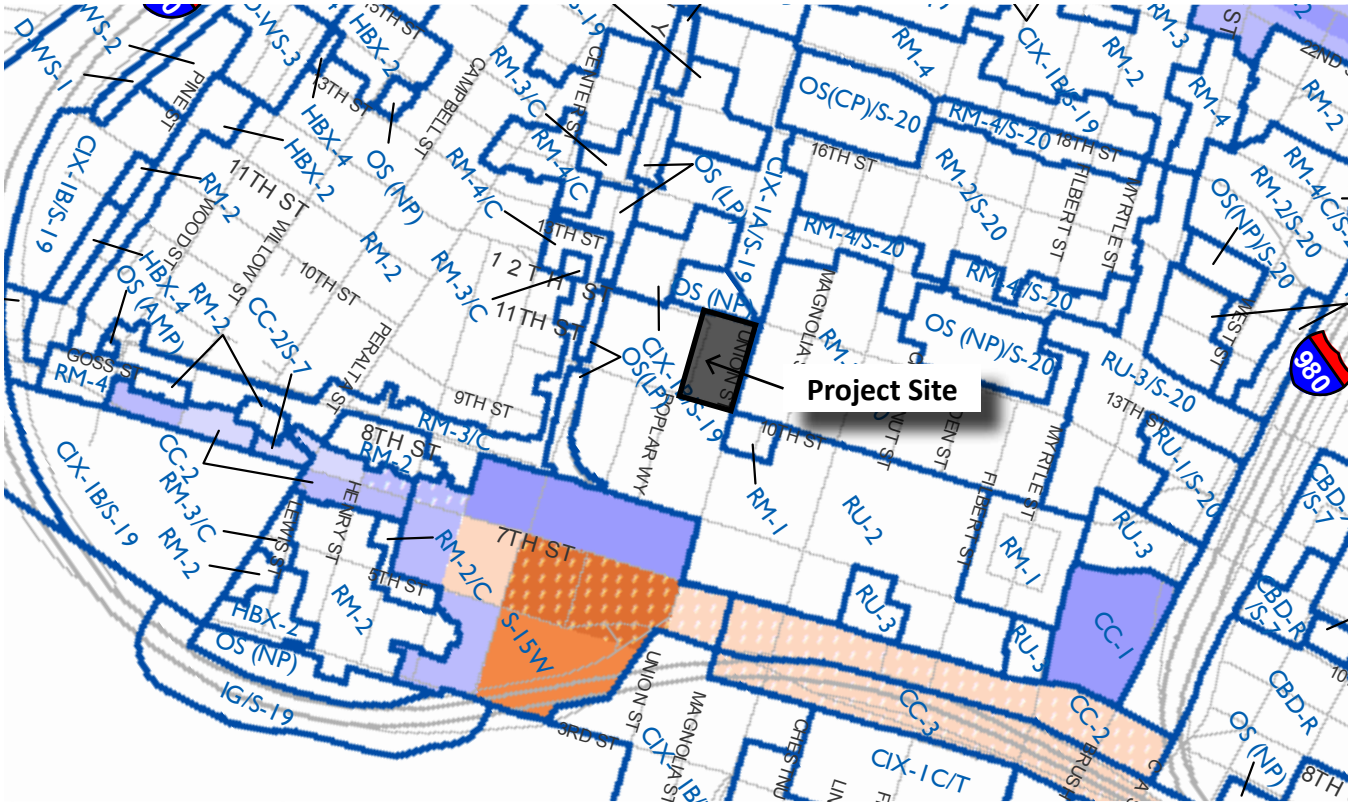
The City of Oakland's General Plan Land Use and Transportation Element (LUTE) and Land Use Diagram (see **Figure 4**) classifies the Project site and surrounding blocks to the west and south as Urban Residential. The intent of the Urban Residential classification is to, "create, maintain and enhance areas of the City that are appropriate for multi-unit, mid-rise or high-rise residential structures in locations with good access to transportation and other services. The primary future use in this classification is residential, but mixed-use buildings that house ground floor commercial uses, and public facilities of compatible character, are also encouraged." The Project would be considered a public facility, as referred to in this land use classification.[4]

The neighborhood immediately to the east and across Union Street from the Project site has a land use classification of Mixed Housing Type Residential. This land use classification generally applies to many of the older established neighborhood housing areas of Oakland, where a mix of unit types (single family homes, townhouses, and small multi-unit buildings) along with small-scale neighborhood-serving businesses, are frequently found in close proximity to each other.

Zoning

The Project site and the surrounding blocks to the west and south are zoned Urban Residential Zone-2 (RU-2) (see also **Figure 4**).[5] The intent of the RU-2 zone is to, "create, maintain, and enhance areas of the City that are appropriate for multi-unit, low-rise or mid-rise residential structures and neighborhood businesses where appropriate in locations with good access to transportation and other services". Pursuant to Oakland Municipal Code (OMC) Table 17.19.01: Permitted and Conditionally Permitted Activities, community assembly, community education, and civic administration land uses are conditionally permitted activities within this zoning district. Pursuant to OMC Section 17.19.050, the property development standards in the RU-2 zone require 10-foot front setbacks, 4-foot side yard setbacks, and 15-foot rear yard setbacks. The maximum building height limit is 50 feet for the primary building and 15 feet for accessory structures.

Relevant Provisions of the California Government Code



California Government Code, Section 53095 (2017) provides that, "the governing board of a school district . . . by a vote of two-thirds of its members, may render a city or county zoning ordinance inapplicable to a proposed use of property by the school district. The governing board of the school district *may not* take this action when the proposed use of the property by the school district is for non-classroom facilities, including, but not limited to warehouses, *administrative buildings*, and automotive storage and repair buildings" (emphasis added). This provision of the California Government Code does not exempt the portion of the proposed Project that is to be used for administrative use, from the requirements of the City Planning Code.

Zoning Map, Project Site as Urban Residential-2 (RU-2)

Figure 4
City of Oakland General Plan and Zoning

Source: City of Oakland, at: https://www.oaklandca.gov/resources/zoning-map

Detailed Description of the Project

As further described below, the proposed Project is a phased approach to redevelopment of the Project site. This approach provides the District with the capability of building and furnishing the new space over time, as funding is allocated to the Project and as the Board of Education makes final determinations for the best use of the building space within the Project. The phasing sequence is as follows:

- The first phase of the Project includes removal of all existing building foundations on the northerly portion of the site. All existing concrete, pavement and asphalt, existing on-site utility infrastructure and fencing on the northerly portion of the site would be removed and disposed of.
- After the northerly portion of the site has been cleared, remediation of soil contaminants from throughout the site (except soils under the Cole Building) would occur. This remediation generally involves excavation and removal of the top three feet of soil from across the site, to be conducted in phases (see detailed description of Remediation, below).
- During the removal of the on-site soils, new clean fill will be brought to the site to reestablish existing grade. The clean fill will be placed back into the excavated area as reworked engineered fill, and the northerly portion of the site would be regraded to accommodate a new building.
- Once all site preparation and remediation activities are complete on the northerly portion of the site, the Project would involve construction of a new, two-story, 56,176 square-foot Cole Administrative /Education Center building on the northwest portion of the site.
- With completion of the Cole Administrative /Education Center building shell, the District's main computer servers and equipment (the Data Center, which is currently housed in the Cole Middle School building) would be relocated into the new Administrative /Education Center building, so that this critical function can continue to operate throughout the construction process.
- Once the Data Center has been relocated, the existing Cole Middle School building on the southerly portion of the site would be demolished. All existing building foundations, concrete, pavement and asphalt, existing on-site utility infrastructure and fencing on this portion of the site would be removed and disposed of, and this portion of the site would be graded to accommodate new parking.
- The Project's construction would be completed with installation of site landscape and hardscape improvements.

Further details for each of these phases of development are provided below.

Site Remediation/Excavation and Fill

As is more fully described in the Hazards and Hazardous Materials section of this Initial Study, a Preliminary Endangerment Assessment for the property was conducted, and a Preliminary Environmental Assessment Work Plan was approved by DTSC.[6] Pursuant to that PEA, lead and arsenic was detected in soil samples from throughout the site, at levels that exceed DTSC screening levels. DTSC requires remediation of soil contaminated with lead and arsenic during the construction phase of the Project, and soil excavation and off-site disposal is the preferred remedial action alternative. This remediation will be separated into Phase 1 and Phase 2 remediation areas to accommodate the Project's construction schedule (see **Figure 5**).

[6] Ninyo and Moore, Preliminary Endangerment Assessment (PEA) Work Plan, August 2021, approved by DTSC October 21, 2021, per DTSC Envirostor website at https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60003015

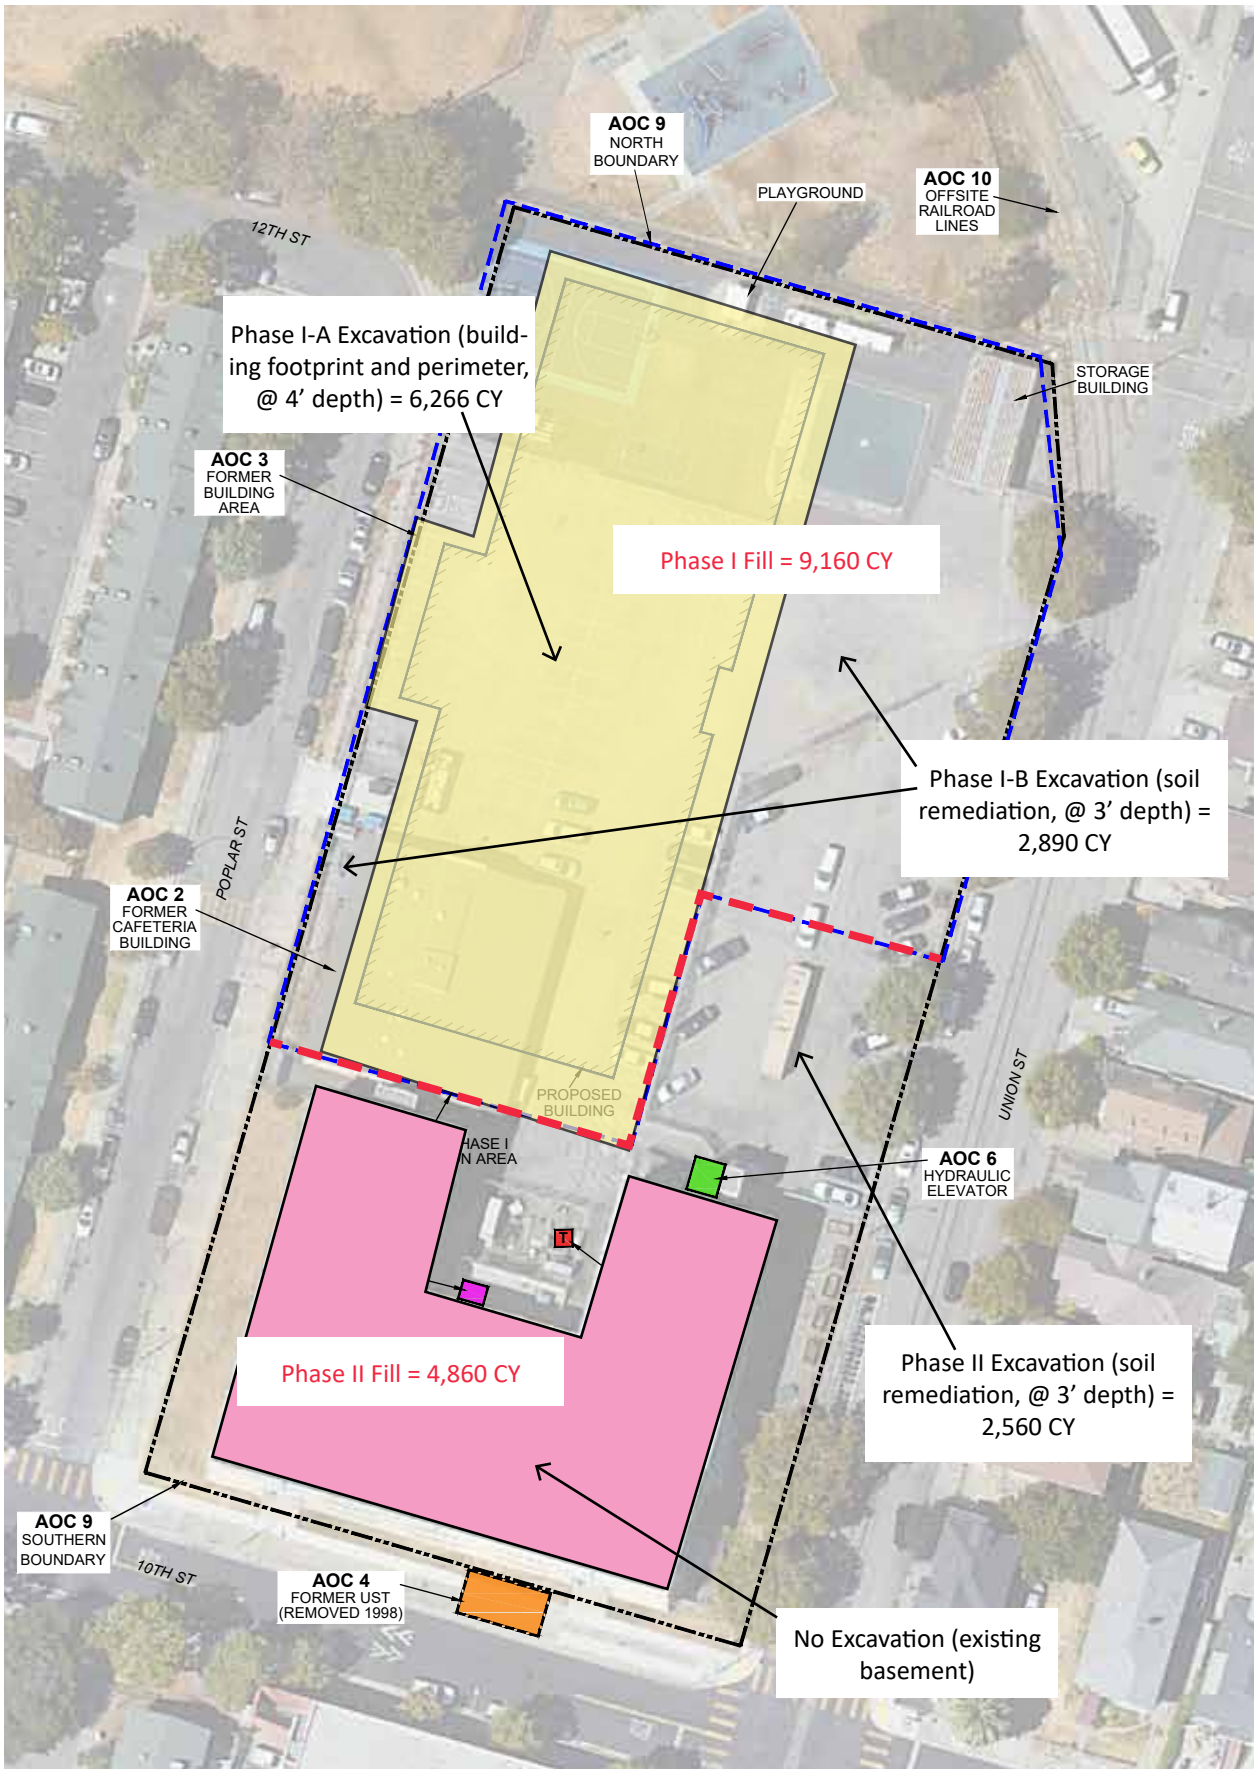

Figure 5
Soil Cut and Fill, for Site Preparation and Remediation

Source: Ninyo & Moore, March 2022

- Phase 1 will occur on an approximately 1.6-acre (67,000 square-foot) northerly portion of the site, and will include excavation of the area below the planned Cole Administration/Education building to a depth of 4 feet (as needed for the structure's foundation). Phase I will also include excavation of approximately 26,000 square feet of the remainder of the Phase I area to a depth of 3 feet, to remove/remediate soils with lead and arsenic concentrations at levels that exceed DTSC environmental screening levels. In total, Phase I remediation (plus excavation for the building foundation) will involve excavation and off-haul of approximately 9,160 cubic yards (CY) of soil.
- Once the building foundation is constructed, the Phase I portion of the site would be refilled with a similar amount of imported clean fill, reworked as engineered fill across the site.

After completion of the Cole Administrative /Education Center building shell, remediation of the Phase II portion of the site would commence.

- Phase 2 remediation will include the remaining area of the site, beginning with demolition and removal of the existing Cole Middle School building. That building has a basement level, so the remaining area surrounding the building foundation (approximately 23,000 square feet) will be excavated to a depth of 3 feet to remove/remediate soils with lead and arsenic at levels that exceed DTSC environmental screening levels. This would involve excavation and off-haul of approximately 2,560 CY of soil.
- The Phase II remediation portion of the site would then be refilled with a similar 2,560 CY of imported clean fill, and an additional 2,300 CY of imported clean fill will be needed to raise the prior basement level of the former Cole building to grade, for a total fill import of approximately 4,860 CY of clean fill material.

In total, the Project's site work (inclusive of soil remediation) will involve approximately 11,720 CY of soil export and 14,020 CY of clean fill import.

Prior to implementation of any proposed remediation (i.e., the proposed soil excavation and off-haul), the District will need to enter into a School Cleanup Agreement with DTSC. Pursuant to that Agreement, the District will develop detailed Remedial Action Work Plans (RAW) for DTSC approval for Phase 1 and Phase II remediation, and prepare Soils Management Plans and Health & Safety Plans, all subject to DTSC approval.

Remedial Action Workplan

The Phase I RAW will identify the remediation goals and objectives, and the performance measures for soil excavation and off-site disposal of lead and arsenic-contaminated soil. The RAW is subject to review and final approval from DTSC. Sections of the RAW will include:

- Description of the Removal Action process, site background information, description of the nature, source and extent of contamination, a risk evaluation and clean up goals, and an engineering evaluation/cost analysis
- All Applicable or Relevant and Appropriate Requirements (ARARs), including chemical-specific ARARs in accordance with DTSC human health risk screening process (including Air Quality Management and a Health and Safety Plan), action-specific ARARs (for waste management, storm water discharge and quality assurance) and location-specific ARARs
- RAW implementation, which will include field documentation, site preparation and security measures, identification of work zones, the excavation plan, meteorological and air monitoring, a Sampling and Analysis Plan (waste characterization and excavation confirmation sampling), a Transportation Plan for off-site disposal, backfill and site restoration plans, and a Project Schedule and Report of Completion.

A similar RAW will be needed prior to initiation of any remediation efforts in the Phase II area, which will also need to address delineated-lead contaminated soil around the current Cole school building, and further evaluation of soil vapor in the southern Phase II portion of the site.

Soils Management Plan

A Soil Management Plan (SMP) will be implemented during future remediation excavation and construction activities to protect construction workers, site occupants and off-site receptors from potential exposure to lead and arsenic in the soil. The SMP will serve as the guidance document for evaluation of clean, contaminated and hazardous soils during soil disturbance activities. Sections of the SMP will include:

- A program of participant roles and responsibilities, description of the physical setting, soil screening criteria, soil management objectives, remedial actions and notifications
- Health and Safety plans, including a discussion of proper personal protective equipment (PPE) to mitigate direct contact exposure of contaminated soils to site workers
- Delineation of exclusion work zones and hazard warning signage, best management practices (BMPs) for PPE and equipment decontamination and site worker hygiene
- Soil excavation and monitoring, soil segregation, stockpiling soil and stockpile management, including proper storage of excavated soils to prevent cross contamination (e.g. stockpiling on plastic sheeting and covering) and soil testing
- Clean imported fill based on DTSC requirements
- Risk management measures

The District will prepare separate site-specific Health and Safety Plans and a Soil Management Plans for DTSC approval prior to any work in Phase I and Phase II areas, where contractors will be working in, or excavating soil.

Site Grading

Following the remediation and excavation/fill process for the site, finish grading is generally anticipated to be minor surface grading to establish new site grades. Finish grade at the Project site is generally flat, with elevations of between 16 to 18 feet above mean sea level (msl).[7] Finish grading of the entire site will be conducted to provide a flat building pad at elevation 19 feet above msl at the northwest portion of the site, at 18.5 feet above msl at the northeast portion of the site, and at elevations of between 16 and 18 feet above msl at the southern portion of the site. These elevations will provide for positive drainage of the site, away from future building locations.

Administrative /Education Center Building Construction

Once all site preparation activities are complete on the northerly portion of the site, the Project would involve construction of a new two-story, 56,176 square-foot Cole Administrative /Education Center building on the northwest portion of the site. The District has considered numerous options for how to best program the space in this new building, and has concluded with the following programming of this space:

- The 28,826 net square-foot first floor of the Administrative /Education Center building would hold new OUSD school functions, accommodating the OUSD Adult and Career Education

[7] Shah Kawasaki Architects and Siegfried Engineers, *Grading Plan*, Sheet C-104 of Central Administration Center at Cole Campus submittal to State Architects, March 9. 2021

programs. The first floor of the building would include an entry lobby, 13 to 14 new classrooms, 3 offices/meeting rooms, an IT Department workroom and a separate server room relocation of the Data Center, plus multiple spaces for storage, hallways and circulation (staircases and elevators), restrooms and utility rooms (see **Figure 6**).

- The 27,350 net square-foot second floor of the Administrative/Education Center building would include a large meeting room, 3 large open office spaces (each over 2,300 sf), 34 individual office spaces and 23 shared offices/collaboration rooms/huddle rooms. Accessory spaces include a central lobby at the elevator bays, multiple spaces for storage, hallways and staircases, elevator bays, restrooms and utility rooms (see **Figure 7**).

Furnishing and occupancy of this building may occur in phases. For example, the second floor administrative offices may be furnished and occupied as part of a first phase, and the first floor may remain as "shell space" while the District defines a specific educational program plan for the first floor classrooms.

Parking

Parking for the Project will be provided in two separate parking areas of the site. The first is a 63-space parking lot at the southern portion of the site, with access via one curb cut on 10th Street. The second is a 30-space parking area on the westerly portion of the site near the entrance to the Administrative/ Education Center building, with a one-way looped driveway (2 curb cuts) off of Union Street (see **Figure 8**). Included within the 93 total parking spaces are 5 ADA-accessible spaces (including two accessible van spaces), 10 EV-ready spaces, 10 EV spaces with electrical conduit installed, and 10 designated clean-air vehicle spaces.

The Project would also provide a total of 8 short-term bike racks, located between the staff parking lot and the Administrative/Education Center building; and 16 long-term bike lockers, located at the rear of the building along Poplar Street.

Landscape

Landscape plans for the Project include three primary landscape elements: a hardscaped/landscaped main entry to the Administrative/Education Center building, perimeter landscaping around the building, and parking lot and streetscape landscaping (see prior Figure 8).

- The primary entry to the Administrative /Education Center building is on the east from Union Street, adjacent to the visitor's parking lot. This entry includes a large, decorated concrete entry court with seat benches, bollard lighting and framed by two rows of flowering trees, intended to provide a spacious and welcoming entry to the building (see **Figure 9**).
- The entry is connected to a decorative concrete walkway across the entire front of the building, with a planter boxes and seating benches. The decorated concrete entry and walkway has a circular or serpentine design to add interest to the paving materials.
- A courtyard provides a secondary staff entrance to the southerly façade of building, separated by landscaped beds of trees, shrubs and groundcover.
- A perimeter sidewalk surrounds the building on the west and north facades, separated from Poplar Street and the adjacent Wade Johnson Park by generous planter beds of trees, shrubs and groundcover.
- The staff parking lot and the visitor parking lot are also separated from the adjacent streets by planter beds of street trees, shrubs and groundcover.

Perimeter landscape beds provide dual purposes of attractive landscape features, as well as stormwater treatment as bio-swales and stormwater filtration. Additionally, the Project proposes that at least 80% of all landscape will be comprised of native California species, and capable of achieving a 20% reduction in otherwise required water demands.

Sustainability

The Collaborative for High Performance Schools (CHPS) was founded in 1999 as a collaboration of California's major utilities to address energy efficiency in schools. The program was developed specifically to reduce energy consumption in California's K-12 educational facilities as a means of reducing operating costs. CHPS quickly expanded to address all aspects of school design, construction, and operation, and is now a nationally recognized evaluative tool for measuring high-performance school buildings. The CA-CHPS provides California-specific criteria for defining high performance schools, and addresses topics of integration, indoor environmental quality, energy, water, site, materials and waste management, and operations metrics. School districts are encouraged to adopt the CA-CHPS criteria for their new and existing schools.

Of the total 250 points used in the CA-CHPS Criteria, 200 points are dedicated towards achievement of "core criteria" of maximize the health, well-being and performance of students, educators and staff; conserving energy, water and other resources to minimize greenhouse gas emissions and reduce operating costs; and practicing good environmental stewardship within schools to achieve community environmental goals. Per the latest CA-CHPS Criteria, non-classroom buildings are now eligible for CHPS "Designed" and CHPS "Verified"/"Verified Leader" recognition.[8] Taking into consideration the wide range of building uses and project scopes for classroom and non-classroom spaces, the 2021 CA-CHPS Criteria establishes point thresholds for "CHPS Designed/Verified" at 83 points out of a possible 250 points, and 120 points as the threshold for "CHPS Verified Leader".

[8] Collaborative for High Performance Schools, *CA-CHPS Criteria*, Version 2.0, June 6, 2021

Figure 9
Proposed OUSD Cole Administrative/Education Center - Entry Rendering

Source: Shaw Kawasaki Architects, Plan Set Sheet A-001, 3/29/21

Based on the CA-CHPS Worksheet prepared by the District for the Cole Administrative /Education Center building, the Project's design and operational plans achieve a total of 112 points, exceeding the CA-CHPS criteria for a CHPS Designed/Verified building, and achieving all CA-CHPS pre-requisite criteria as well as all CalGreen/Title 24 measures.[9]

Utilities

On-site utilities would include electricity, domestic water, wastewater, and storm drainage. No natural gas service is planned for the Project. East Bay Municipal Utility District (EBMUD) provides municipal water and sewer treatment and disposal, the City of Oakland generally owns and maintains local sewer lines within the public right-of-way. Pacific Gas and Electric (PG&E) provides electric service. All on-site utilities would constructed and operated in accordance with applicable codes and current engineering practices. Trash receptacles would be located adjacent to the staff parking lot near the corner of 10th Street and Poplar Street for easy access for pick up by solid waste service providers, placed together with a back-up generator to ensure power for the Project elevators in the event of a power outage, as well as back-up power for the Data Center.

Staffing Occupancy and Adult/Continuing Ed Programming

OUSD Administrative Staff

The District had originally anticipated the need for new administrative building space to accommodate as many as 337 OUSD administrative staff in order to reunify their staff into one centralized location. However, of these 337 current OUSD administrative staff, 180 administrative staff member work at school sites and they will remain at those locations. The remaining 157 administrative staff members will be 'assigned' to work at the Cole building. These 157 'assigned' employees' work schedule is assumed as follows

- For new OUSD administrative facilities such as Cole, the District presumes that 50% of the 'assigned' staff will permanently work from home, and only come in for required face-to-face meetings. At the new Cole Building, 50% of 'assigned' employees (or 78 employees) will work from home, and only come to the Cole building once a week for meetings. For planning purposes, it is assumed that these employees will be on a rotating meeting schedule, with 15 of these employees 'reporting' to Cole each day on a once-weekly meeting basis.
- Of the remaining 50% of employees 'assigned' to Cole, approximately 60% (or 47 employees) will be on a rotating work schedule, and will reserve a workstation via the School's app. For planning purposes, it is assumed that half of these 47 employees come in every other day, meaning that 23 of these rotating schedule employees will report every day.
- Of the remaining 50% of employees 'assigned' to Cole, approximately 40% (or 31 employees) will report every day.

Based on these assumptions, the daily employee population at the Cole building will be 31 every day employees, and 23 daily rotating employees, and 15 weekly meeting employees, for approximately 70 OUSD administrative staff employees on the second floor of the Cole building on a daily basis.

Adult/Continuing Ed Programming

The first floor of the Cole Administrative /Education Center building would hold new OUSD school functions, accommodating the OUSD Adult and Career Education programs. The current Oakland Adult

[9] Shah Kawasaki Architects, CHPS Scorecard, Sheet A-005 of Central Administration Center at Cole Campus submittal to State Architects, February 19, 2021

and Career Education program offers classes in High School Diploma/Credit Recovery and High School Equivalency (GED/HiSET), English as a Second Language (ESL), College & Career Readiness Pathways, ESL Citizenship, Pre-Apprenticeship Math, FabLab (classes in how to use digital manufacturing machines and design software) and Project SEARCH (internships for adults with developmental disabilities). Currently, the majority of these Programs are held at McClymonds High School in West Oakland. The Project would enable consolidation of the Oakland Adult and Career Education program at the Cole site, and enable the District to re-program McClymonds to better accommodate the high school needs of the District.

It is assumed that the OUSD Adult and Career Education program would continue to offer classes on its current schedule, with certain classes offered between 9:00 to 12:00 AM, certain classes offered between 1:00 and 4:00 PM, and other classes offered between 6:00 and 8:30 PM. For planning purposes, it is further assumed that a total of approximately 100 students and faculty will attend the morning class schedule, approximately 100 students and faculty will attend the afternoon class schedule, and as many as 175 students and faculty will attend the evening class schedule. At these attendance rates and schedules, and assuming a ratio of about 20 persons (students and faculty) per class, not all classrooms on the first floor will be occupied during the day. This will allow for overlap in scheduling, and reserving certain classrooms for specific programming purposes.

Approvals Required for the Project

The following approvals have already been obtained for the Project:

OUSD Board of Education

- Approval for expenditures to design the Project, approved by the Board per Resolution No. 1920-2024, September 11, 2019
- Approval for expenditures to construct the Project, approved by the Board per Resolution No. 2021-0305, June 30, 2021

California Division of the State Architect and State of California Natural Resources Agency/Department of Conservation/California Geological Survey

- Review and approval of building design (building permits) and construction for compliance with State/DSA building code requirements related to structural safety, fire and life safety, accessibility and sustainability, approved by the Division of the State Architect per Application No. 01-119003, April 1, 2021
- Review and approval of engineering geology and seismology, based on Geotechnical engineering and Geologic study dated May 22, 2022, approval granted by California Geological Survey on October 2, 2022 for CGS Application No. 01-CGS4511
- Oakland Fire Department/Fire Prevention Bureau: AMR Request #2020-39514 (Minimum Fire Apparatus Road Width), approved on October 26, 2021

The following additional approvals, permits and/or authorizations are required pursuant to Project implementation:

OUSD Board of Education

- Approval for final occupancy of the anticipated mixes of uses of the building

City of Oakland

- Conditional Use Permit (CUP) for administrative office use in a residential zone
- Tree permit for the removal of four trees from the Project's frontage along Union Street

- Post-Construction Stormwater Management Plan (SWMP) – City as the NPDES discharge permittee
- Encroachment permit for any work within the public right-of-way
- Oakland Fire Department/Fire Prevention Bureau: Hydrant/Fire Service Application #2022-00496 submitted January 28, 2022
- Oakland Fire Department/Fire Prevention Bureau: ERRC #2021-95521 (pending)

California Department of Toxic Substances Control

- Approval of a Final Preliminary Environmental Assessment
- Voluntary Cleanup Agreement or School Cleanup Agreement
- Removal Action Work Plan or Remedial Action Plan, including Soil Management Plan
- Oversight of cleanup activities
- "No Further Action" letter

California State Water Resources Control Board / San Francisco Bay Regional Water Quality Control Board

- Coverage under the Construction General Permit (CGP), pursuant to the Project's submitted Notice of Intent (NOI)
- Stormwater Pollution Prevention Plan, pursuant to CGP

Bay Area Air Quality Management District (BAAQMD)

- Report to the Air Pollution Control Officer, with a description of emission controls used for demolition and removal of any asbestos-containing materials, pursuant to BAAQMD Regulation 11, Rule 2
- Permits pursuant to CARB's Stationary Diesel Airborne Toxics Control Measure (ATCM) for the Project's proposed diesel-powered emergency generator

East Bay Municipal Utility District (EMUD)

- Service connections for new water and firewater service

Initial Study Checklist

Environmental factors that may be affected by the Project are listed by topic below. Factors marked with a solid box ("■") were determined to be potentially affected by the Project, involving at least one impact that is a potentially significant impact as indicated by the Checklist on the following pages. Unmarked factors ("☐") were determined to not be significantly affected by the Project, or reduced to a level of less than significant through mitigation, based on analysis and discussion provided in the Checklist.

☐ Aesthetics	☐ Agricultural Resources	☐ Air Quality
☐ Biological Resources	☐ Cultural Resources	☐ Energy
☐ Geology/Soils	☐ Greenhouse Gas Emissions	☐ Hazards/Hazardous Materials
☐ Hydrology/Water Quality	☐ Land Use/Planning	☐ Mineral Resources
☐ Noise	☐ Population/Housing	☐ Public Services
☐ Recreation	☐ Transportation	☐ Tribal Cultural Resources
☐ Utilities/Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

The Checklist portion of the Initial Study begins on the following page, with explanations of each CEQA issue topic. Four outcomes are possible, as explained below.

1. A "no impact" response indicates that no action that would have an adverse effect on the environment would occur due to the Project.
2. A "less than significant" response indicates that, while there may be potential for an environmental impact, there are standard procedures or regulations in place, or other features of the Project as proposed, which would limit the extent of this impact to a level of "less than significant".
3. Responses that indicate that the impact of the Project would be "less than significant with mitigation" indicate that mitigation measures identified in the Checklist analysis will be required as a condition of Project approval, and that implementation of those mitigation measures would effectively reduce potential Project-related environmental impacts to a level of "less than significant".
4. A "potentially significant impact" response indicates that further analysis is required to determine the extent of the potential impact and to identify appropriate mitigation. If any topics were to be indicated with a "potentially significant impact", these topics would need to be analyzed in an Environmental Impact Report.

Aesthetics

Would the project:	Potentially Significant	Less Than Significant With Mitigation	Less Than Significant	No Impact
a) Have a substantial adverse effect on a scenic vista?	❒	❒	❒	■
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	❒	❒	❒	■
c) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	❒	❒	■	❒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	❒	❒	■	❒

Scenic Vistas and Scenic Resources

The Project site is located in an urbanized area with no significant scenic vistas. Development of the Project would demolish the existing 1- and 2-story buildings on the site to develop a new 2-story mixed office/classroom building and surface parking (see prior Figure 8). The new building would be of similar scale and bulk as the adjacent Oakland Housing Authority office building on the south side of 10th Street. The Project's new building would not adversely affect a scenic resource.

According to the City of Oakland General Plan's Scenic Highways Element, scenic routes are "distinctively attractive roadways that traverse the City and the visual corridors which surround them". Current and future scenic routes may include officially designated State scenic highways, municipally designated City roadways or informally recognized local scenic byways. Within the City of Oakland, the entire length of I-580 from the San Leandro city limits to the San Francisco-Oakland Bay Bridge is identified as a designated scenic route. The segment of I-580 from the San Leandro city limit to State Route 24 is also an officially designated State scenic highway. I-980 is identified as a route that could be considered for possible future designation. The nearest segment of I-580 is the elevated Oakland Maze, approximately 1.2 miles from the Project site. This segment of the freeway is elevated, allowing views across West Oakland, but at this distance the Project will not be distinctly visible and will not substantially damage any scenic resources within or adjacent to a state scenic highway.

Scenic Quality

The Project is located in an urbanized area, and the applicable CEQA threshold related to potential impacts to scenic quality is whether the Project would conflict with applicable zoning and other regulations governing scenic quality. The Project site is located within an area zoned as Urban Residential Zone-2 (RU-2). Therefore, the following provides a brief comparison of the Project to the development standards of the RU-2 zoning district:

Building Setbacks

Pursuant to OMC Section 17.19.050, the property development standards in the RU-2 zone require 10-foot front setbacks, 4-foot side yard setbacks, and 15-foot rear yard setbacks. Since the Project includes an entire block, the larger 10-foot front setback is assumed to apply to the Poplar Street, 10th Street and Union Street frontage. [10]

Consistent with these development standards, the Project maintains at 10-foot setback to the nearest wall along Union Street, a 30-foot setback to the trash enclosure and generator structure nearest to 10th Street, and more than 19-foot setback to the nearest wall of the Multi-Purpose Building from Union Street (see **Figure 10**). The Project also maintains a 20-foot setback from Wade Johnson Park, greater than both the 4-foot side yard or 15-foot rear yard setback. The Project complies with all setback requirements.

Building Height

The maximum building height limit in the RU-2 zone is 50 feet for the primary building, and 15 feet for accessory structures. Buildings in the RU-2 zone are also limited to a 30-foot maximum height at the setback line along any rear or interior side lot line that abuts a lot within a residential zone (i.e., in an RH, RD, RM, or RU-1 Zone). This maximum height may increase by 1 foot for every foot of distance away from the setback line.

The proposed Cole Building has a roof height of 33 feet, with a sloped roof that extends to a maximum of 37'-10" (see **Figure 11**). This building is below the maximum building height of 50 feet. To the north, the Wade Johnson Park is zoned as Open Space (OS), and the building height limits for buildings adjacent to residential zones does not apply.

Lot Coverage and FAR

The RU-2 zone does not include any development standards relative to building coverage of the lot or FAR. The Project is consistent with all applicable zoning and other regulations governing scenic quality.

Conclusions

Based on the above, the Project would not conflict with any applicable zoning and other regulations governing scenic quality. The new building would provide an inviting architectural focal point and an overall positive improvement to the existing visual character of the area. The Project would be contemporary in design and include amenities such as street-level landscaping and lighting. As such, the Project's effect related to scenic quality would be less than significant.

Project’s Consistency with Building Height Limits (50-feet)

Source: Shah Kawasaki Architects, Sheet A-201, March 2021

Light and Glare

Evening activities at the Project would include late afternoon and evening classes for the OUSD Oakland Adult and Career Education program and after-hours office use of staff workstations. The Project site and other land uses in the vicinity currently generate outdoor lighting typical for an urban area. The Project would add to the existing light sources with building, parking lot and landscape lighting. The Project proposes a wide array of outdoor lighting fixtures, including the following:

- recessed wall-mounted lighting fixtures at the building entry plaza
- exterior recessed downlights at the main entry doorway
- recessed step lights at the Poplar Street entry ramps
- exterior bollard-style lights along the walkways at the Poplar Street, Wade Johnson Park and parking lots sides of the new building
- exterior pole-mounted area lights at the entry and exits to the guest parking lot
- exterior wall-mounted floodlights along the front (easterly) façade of the new building, between the parking lot and the entry
- exterior wall-mounted downlights across the front (easterly) and side (southerly) façades of the new building
- exterior pole-mounted single-head lights and exterior pole-mounted double-head lights along the perimeter of the employee parking lot
- exterior wall-mounted area lights at the generator and trash enclosure [11]

All of these light fixtures are energy efficient LED directional lights that would minimize "light spill", and are either downcast, box-enclosed, or have hooded shields to a point below the light bulb and reflector to prevent unnecessary up lighting and glare onto adjacent properties. Increases in light at the closest residential and commercial uses would be consistent with the existing urban setting and the overall effect of the exterior lighting of the building and parking areas would not be substantially different from the current levels of night lighting from the existing Cole building and its parking areas. Potential impacts related to light and glare would be less than significant.

[11] Shah Kawasaki Architects and Interface Engineering, Luminaire Schedule, Sheet E-002 of Central Administration Center at Cole Campus submittal to State Architects, March 2021

Agriculture and Forestry Resources

Would the Project:	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	❒	❒	❒	■
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	❒	❒	❒	■
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production(as defined by Government Code section 51104(g))?	❒	❒	❒	■
d) Result in the loss of forestland or conversion of forestland to non-forest use?	❒	❒	❒	■
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forestland to non-forest use?	❒	❒	❒	■

Agricultural and Forestry Resources

The Project site is located in a developed, urban area and is not identified as being prime farmland, unique farmland, or farmland of statewide or local importance pursuant to the Farmland Mapping and Monitoring Program of the California Resource Agency, and is not under a Williamson Act contract.[12] The Project site does not contain forestland or timber resources, nor is it zoned for forestland or for timber production. The Project site has a General Plan designation of Urban Residential, and adjacent properties are similarly designated. There are no agricultural or forestry uses existing in the immediate area. The proposed Project would not conflict with agricultural or forestland zoning or with Williamson Act contracts. No impact would occur.

[12] California Department of Conservation. Website accessed January 3, 2020 at: ftp://ftp.consrv.ca.gov/pub/dlrp/FMMP/pdf/2014/ala14.pdf

Air Quality

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. a) Conflict with or obstruct implementation of the applicable air quality plan?	❒	❒	❒	■
b) Result in a cumulatively considerable net increase of any construction-period criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	❒	■	❒	❒
c) Result in a cumulatively considerable net increase of any operational-period criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	❒	❒	■	❒
c) Expose sensitive receptors to substantial pollutant concentrations?	❒	■	❒	❒
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	❒	❒	❒	■

Conflict with Air Quality Plan

The Project site is subject to the Bay Area Clean Air Plan, last adopted by the Bay Area Air Quality Management District (BAAQMD) in 2017 to meet state requirements and those of the federal Clean Air Act. The plan is meant to demonstrate progress toward meeting the ozone standards, and includes other elements related to particulate matter, toxic air contaminants, and greenhouse gases.

A project is judged to conflict with or obstruct implementation of the Clean Air Plan if it is inconsistent with regional growth assumptions or hinders implementation of air pollution emissions control strategies. The land use proposed for the Project (administrative and educational uses) is consistent with regional growth assumptions, and does not include any activities that would hinder implementation of air pollution emissions control strategies of the Clean Air Plan. The Project would not conflict with or obstruct implementation of the Bay Area Clean Air Plan, and there would be no impact.

Air Quality Standards for Criteria Pollutants

Ambient air quality standards have been established by state and federal environmental agencies for specific air pollutants most pervasive in urban environments. These pollutants are referred to as criteria air pollutants because the standards established for them were developed to meet specific health and welfare criteria set forth in the enabling legislation and include ozone precursors (nitrogen oxides and reactive organic gases), carbon monoxide, and suspended particulate matter (PM_{10} and $PM_{2.5}$). The Bay Area is considered "non-attainment" for ozone and particulate matter. Past, present and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. Very few types of single projects are sufficient in size, by themselves, to result in non-attainment of ambient air quality standards. Instead, a project's individual emissions may contribute to existing cumulatively significant adverse air quality impacts. If a

project's contribution to a cumulative impact were considerable, then the project's impact on air quality would be considered significant.[13]

BAAQMD's most recent CEQA Guidelines (May 2017) include recommended thresholds of significance. These thresholds are average daily emissions of 54 pounds per day or 10 tons per year of nitrogen oxides (NO_x), reactive organic gases (ROG), and $PM_{2.5}$, and 82 pounds per day or 15 tons per year of PM_{10}. Both the daily and annual thresholds apply to operation, and only the daily thresholds apply to construction. The project's potential air quality impacts fall into two categories: short-term impacts that would occur during construction, and long-term impacts due to Project operation.

Construction-Period Criteria Pollutant Emissions

Construction activities associated with the Project would generate fugitive dust in the short-term. Construction activities may result in significant quantities of fugitive dust emissions, including PM_{10} and $PM_{2.5}$, on a temporary and intermittent basis during the construction period. Emissions from off-road vehicles and construction equipment may also contribute to criteria pollutant emissions.

The BAAQMD's 2017 CEQA Guidelines provide preliminary screening levels that provide the Lead Agency with a conservative indication of whether a proposed project would result in the generation of construction-related criteria air pollutants and/or precursors that exceed the thresholds of significance. If all of the screening criteria can be met, construction of the Project is presumed to result in a less than significant impact related to criteria air pollutant and precursor emissions. The size of the Project does meet applicable screening level size. However, the Project does include demolition, simultaneous occurrence of more than two construction phases, and substantial soil import/export. Accordingly, the screening criteria was not used, and instead the Project's construction activity was modeled using the California Emissions Estimator Model (CalEEMod) Version 2016.3.2, to estimate Project construction emissions of ROG, NO_X, PM_{10} exhaust, and $PM_{2.5}$ exhaust (see **Appendix A**). Parameters used in modeling of the construction process include the following:

- Construction includes 27.3 thousand square feet (ksf) of government office building space, 28.6 ksf of educational space (using the closest CalEEmod-available land use type of 'Junior College'), and 93 parking spaces
- The construction schedule relies on default values of CalEEMod for the duration of construction phases, for all phases of the Project other than soil import and export. The duration of those construction phases with soil import and export rely on the following Project assumptions:
    - Phase I remediation assumes 9,160 CY of soil export, at 8 CY per haul trip. This results in a total of 1,145 haul trips, at 60 haul trips per day, or 19 days
    - Phase I grading assumes 9,160 CY of soil import, at 8 CY per haul trip. This results in a total of 1,145 haul trips, at 60 haul trips per day, or 19 days
    - Phase II remediation assumes 2,560 CY of soil export, at 8 CY per haul trip. This results in a total of 300 haul trips, at 60 haul trips per day, or 5 days
    - Phase II grading assumes 4,860 CY of soil import, at 8 CY per haul trip. This results in a total of 608 haul trips, at 60 haul trips per day, or 10 days
- The amount to soil import and export by construction phase is as described in the Project Description
- The amount of demolition by construction phase is as described in the Project Description

[13] BAAQMD, *California Environmental Quality Act Air Quality Guidelines*, May 2017

- Haul trip lengths rely on CalEEMod default values of 20 miles per haul trip, except those haul trips exporting contaminated soil. The length of those haul trips was assumed at 200 miles to the nearest licensed landfill
- The types of off-road construction equipment used during each phase of construction is based on CalEEMod default values
- All other input to the construction modeling for criteria pollutant emissions relies on CalEEMod default values

Based on these input parameters, the results of the CalEEMod modeling of construction-period emissions of criteria pollutants is as summarized in **Table 1**. Based on the default values of CalEEMod and the Project-specific assumptions related to soil export and import, the construction period for the Project is assumed to take 12 months to complete.[14] Therefore, the construction-period emissions of criteria pollutants is as summarized in Table 1 represent an annual emissions rate.

According to BAQMD CEQA Guidelines (May 2017), the threshold values for construction-period emissions are an annual average daily emission of 54 lbs. /day for ROG, NOx and PM 2.5, and 82 lbs./day for PM10. To obtain the Project's annual average daily emission, the total annual emission (in tons) as multiplied by 2,000 lbs. per ton, and then divided by 260 construction days per year.

[14] Per the District's general contractor, the actual construction period is estimated to be approximately 15 months. The shortened construction period as calculated by the CalEEMod default assumptions produces as shorter construction period estimate on 12 months. This shorter construction period as estimated by CalEEMod results in the same quantity of criteria pollutants emitted during the construction period, but within a more condensed period. This CalEEmod approach is more conservative (i.e., a worst-case scenario), as it results in greater concentrations of emissions than likely will occur.

Table 1: Construction-Period Criteria Pollutant Emissions				
Emission Sources:	**ROG**	**NOx**	**PM10 (Total)**	**PM2.5 (Total)**

[1] Assumes 260 workdays within a 1 calendar-year period

Source: Lamphier-Gregory 2022, CalEEMod results included in Attachment X

As shown in the table above, the modeled construction-period emissions for the Project indicate that the Project's construction-period emissions would not exceed the significance thresholds, and construction-period emissions of criteria pollutants would be less than significant.

Mitigation Measures and Regulatory Requirements

For all projects, BAAQMD recommends the implementation of all Basic Construction Mitigation Measures, whether or not construction-related emissions exceed applicable thresholds of significance. Whereas these recommendations are not regulatory, they are listed below as mitigation measures.

Mitigation Measure Air-1, Basic Construction Mitigation:

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.

3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.
7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
8. Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

Because the Project includes demolition, simultaneous occurrence of more than two construction phases, and substantial soil import/export, the following additional construction mitigation measures are recommended to address the Project's contribution to local cumulative air quality:

Mitigation Measure Air-2, Additional Construction Mitigation Measures:

1. All exposed surfaces shall be watered at a frequency adequate to maintain minimum soil moisture of 12 percent. Moisture content can be verified by lab samples or moisture probe.
2. All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
3. Windbreaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Windbreaks should have at maximum 50 percent air porosity.
4. Vegetative ground cover (e.g., fast-germinating native grass seed) shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
5. The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
6. All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
7. Site accesses to a distance of 100 feet from the paved road shall be treated with a 6 to 12 inch compacted layer of wood chips, mulch, or gravel.
8. Sandbags or other erosion control measures shall be installed to prevent silt runoff to public roadways from sites with a slope greater than one percent.
9. Minimizing the idling time of diesel powered construction equipment to two minutes.
10. The project shall develop a plan demonstrating that the off-road equipment (more than 50 horsepower) to be used in the construction project (i.e., owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent NOX reduction and 45 percent PM reduction compared to the most recent ARB fleet average. Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels,

engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.

11. Use low VOC (i.e., ROG) coatings beyond the local requirements (i.e., Regulation 8, Rule 3: Architectural Coatings).

12. Require that all construction equipment, diesel trucks, and generators be equipped with Best Available Control Technology for emission reductions of NOx and PM.

13. Requiring all contractors use equipment that meets CARB's most recent certification standard for off-road heavy-duty diesel engines.

Regulatory Requirement Air-3, Asbestos in Structures: The project applicant shall comply with all applicable laws and regulations regarding demolition and renovation of Asbestos Containing Materials (ACM). These include but are not limited to California Code of Regulations, Title 8; California Business and Professions Code, Division 3; California Health and Safety Code sections 25915-25919.7; and Bay Area Air Quality Management District, Regulation 11, Rule 2, as may be amended.

Resulting Level of Significance

Implementation of these regulatory requirements, Air District recommendation, and mitigation measures would reduce construction-period criteria pollutant impacts to levels of less than significant.

Operational Emissions

Operational air emissions from the Project would be generated primarily from automobiles driven by future administrative staff, faculty and students, as well as indirect emissions (i.e., energy used for heating and cooling), as well as other on-site area source emissions.

The BAAQMD's 2017 CEQA Guidelines provide preliminary screening levels that provide the Lead Agency with a conservative indication of whether a proposed project would result in the generation of operations-related criteria air pollutants and/or precursors that exceed the thresholds of significance. If a project meets applicable screening size criteria, operation of that project is presumed to result in a less than-significant impact pertaining to criteria air pollutant and ozone precursor emissions. The applicable screening sizes are 277,000 square feet for government office use, and 152,000 square feet for a junior college (the land use type closest to that proposed for the Project). As shown in **Table 2**, the Project does not exceed either of these screening sizes, and does not exceed 100% of the combined portions of these screening sizes. The Project is presumed to have a less than significant effect related to operational emissions of criterial pollutants.

Table 2: Comparison to Operational Screening Size Criteria

	Government Office	Education (Junior College)	Total
Screening Size	277,000	152,000	
Project	28,826	27,350	
% Screening Size	11%	18%	29%

To verify the less than significant conclusion based on screening size, the CalEEMod emissions model was used to calculate the Project's likely operational emissions of ROG, NOX, PM10 and PM2.5 emissions (see **Table 3**).

Table 3: Operational Criteria Pollutant Emissions				
Non-Mitigated Scenario	**ROG**	**NO_x**	**PM_{10}**	**$PM_{2.5}$**
Area Source Emission	0.2508	0.0001	-	-
Energy Emissions	0.0080	0.0731	0.0056	0.0056
Mobile Source Emissions	0.3569	0.4343	0.7191	0.1955
Waste (Indirect Emissions)	-	-	-	-
Water (Indirect Emissions)	-	-	-	-
Project Operational Emissions (*tons/year*)	**0.6157**	**0.5074**	**0.7246**	**0.2011**
Thresholds (tons /year)	10 tons	10 tons	15 tons	10 tons
Exceed Threshold?	**No**	**No**	**No**	**No**
Project Annual Average Daily Operational Emissions (*lbs/day*)[1]	4.74 lbs.	3.90 lbs.	5.57 lbs.	1.57 lbs.
Thresholds (pounds/day)	*54* lbs.	*54* lbs.	*82* lbs.	*54* lbs.
Exceed Threshold?	**No**	**No**	**No**	**No**

Notes: 1. Assumes 260 days per year of operations

Source: Lamphier-Gregory 2020, CalEEMod results included in Attachment X

As shown in Table 3, CalEEMod results (which do not rely on any assumed mitigation measures incorporated into the Project) indicate that the Project's operational emissions would not exceed the significance thresholds for any of the identified criteria pollutants. Therefore, the Project's impact related to operational criteria pollutant emissions would be less than significant.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations, Construction-Period

As reported in the West Oakland Specific Plan EIR, the California Air Resources Board's West Oakland Health Risk Assessment includes findings that ambient diesel PM concentrations in West Oakland are estimated to be nearly three times the background concentrations averaged over the entire Bay Area. Other reports indicate that the air inside of homes in West Oakland has black soot at nearly 5 times the concentration levels of other Oakland homes. West Oakland residents are 5 times more likely to be hospitalized for asthma, and children in West Oakland are 7 times more likely to be hospitalized for asthma as compared to the average California resident. Heavy-duty trucks on the roadways within West Oakland and on the freeways surrounding West Oakland are the largest contributors of diesel PM. Under the BAAQMD's Community Air Risk Evaluation (CARE) program, West Oakland has been identified as an area with high TAC emissions and sensitive populations affected by these emissions.[15]

Construction activities associated with the Project would generate construction-related TAC emissions, specifically diesel particulate matter (DPM, as both PM10 and PM2.5) from on-road haul trucks and off-road equipment exhaust emissions. These emissions would contribute to ambient air quality emissions from nearby freeways, industrial sites, and the Port, potentially contributing to cumulative cancer risks and non-cancer health concerns at nearby sensitive receptors. The nearest sensitive receptors are those residences adjacent to the Project site along Union Street and Poplar Street.

[15] City of Oakland, *West Oakland Specific Plan Final EIR*, May 2014, page 4-16

The generation of TAC emissions during Project construction would be temporary.[16] There will be an even shorter amount of time when diesel-powered construction equipment will be within an influential distance, and that would result in the exposure of sensitive receptors to substantial concentrations of construction-period TAC. For the most part, the Project would use standard construction equipment such as loaders, backhoes and haul trucks, similar to operations at other construction sites in Oakland. However, the export of contaminated soil and import of new clean fill will result in concentrated periods of one to three weeks at a time when these types of diesel-powered construction equipment will be in all-day operations, potentially generating periodic concentrations of diesel emissions.

Mitigation Measures

Given that the West Oakland community is at high risk for adverse health risks attributable to cumulative air quality conditions, and to address the Project's contributions to these ambient diesel PM concentrations, the following mitigation measure is recommended to substantially reduce the Project's contribution of toxic air contaminants during the construction period.

Mitigation Measure Air-4, Diesel Particulate Matter Controls: The District shall ensure that all off-road diesel equipment used during the construction period, and all haul trucks used for soil export and import for the Project, are equipped with the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type, as certified by CARB. Methods to comply with this standard include, but are not limited to, new clean diesel trucks (Tier 4 engines automatically meet this requirement), higher-tier diesel engine trucks with added Particulate Matter (PM) filters, hybrid trucks, alternative energy trucks, or other methods that achieve the applicable CARB emission standard. This equipment must be properly maintained and tuned in accordance with manufacturer specifications, and verified through an equipment inventory submittal and Certification Statement.

Resulting Level of Significance

The Tier 4 engine standards have been found to reduce emissions of PM and NOx (including small PM emissions of DPM) by approximately 90%, as compared to Tier 2 and Tier 3 engines without such controls. These emission reductions can be achieved through use of advanced control technologies, including advanced exhaust gas after-treatment methods. With a 90% reduction in construction-period emissions of DMP, the Project's emissions of toxic air contaminants would be reduced to levels of less than significant, and its contribution of toxic air contaminants would be a less than cumulatively considerable contribution to overall cumulative air quality.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations, Operations Emissions

The Project would not include any regular operational activities that have the potential to generate substantial amounts of toxic air emissions. The Project's office and classroom spaces are not sources of toxic chemicals or emissions. The Project does include an emergency generator, which would provide the building (especially the elevator) with power supply in the event of a power outage. This emergency generator would only be used in the event of an emergency. It would not operate on a continuous basis.

Regulatory Requirements

Regulatory Requirement Air-5, Emergency Generator – TBACT: The Project's proposed diesel-powered emergency generator will be subject to CARB's Stationary Diesel Airborne Toxics Control Measure

[16] All construction is expected to be completed within 15 months - see prior footnote #14 explaining the difference between CalEEmod-estimated construction schedule and estimated construction schedule per the District's general contractor.

(ATCM), and will require permits from the BAAQMD. As part of the BAAQMD permit requirements, the engine emissions will have to meet Best Available Control Technology for Toxics (TBACT).

Sources of air pollutant emissions complying with all applicable BAAQMD regulations are generally not considered to have a significant air quality or community health risk impact.

Odor Emissions

Operation of the Project would not result in odor emissions that would adversely affect a substantial number of people. During construction, diesel-powered vehicles and equipment would create odors that some may find objectionable. However, these odors would be temporary and not likely to be noticeable much beyond the Project site's boundaries. The Project's impact related to odor emissions would be less than significant.

Biological Resources

Would the Project:	Potentially Significant	Less Than Significant With Mitigation	Less Than Significant	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	❒	❒	■	❒
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?	❒	❒	❒	■
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	❒	❒	❒	■
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	❒	■	❒	❒
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	❒	■	❒	❒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	❒	❒	❒	■

Special Status Species

According to the West Oakland Specific Plan EIR, wildlife use within West Oakland is expected to be relatively low due to the absence of natural habitat, the proximity of streets and development, and the lack of protective cover. Special-status species are not expected to occur within the West Oakland Planning Area because of a lack of suitable habitat, the smaller size and fragmented nature of remaining habitat, prior disturbance, and the current level of human activity. According to the Open Space, Conservation and Recreation Element of the City of Oakland General Plan, there are no special-status species known to occur within West Oakland. [17]

The Project site is located in an urban area that is fully developed. The site contains existing buildings and paved surface parking lots. On-site vegetation consists of shrubs and mature trees along the eastern perimeter of the site, and small grass-covered areas adjacent to boundary sidewalks. The potential for the Project to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species is less than significant.

[17] City of Oakland, *West Oakland Specific Plan Draft EIR*, May 2014, page 4.12-2

Riparian Habitat and Wetlands

There are no riparian habitats, wetlands or other sensitive natural communities on the Project site or in the vicinity. The Project site is entirely covered with buildings and with paved surface parking lots. The adjacent Wade Johnson Park is an urban park with no riparian habitats, wetlands or other sensitive natural communities present.

Wildlife Corridors and Nesting Sites

The Project would not substantially interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. However, future demolition and construction activities associated with the Project could temporarily reduce nesting opportunities for resident and migratory bird species protected by the federal Migratory Bird Treaty Act or California Fish and Game Code Sections 3503, 3503.5, and 3800. Demolition and construction could also eliminate bat roosts and, if construction were to occur during the maternal roosting season, young bats incapable of flight could be destroyed. The California Fish and Game Code prohibit the "take, possession, or destruction of birds, their nests or eggs". Disturbance that causes nest abandonment and/or loss of reproductive effort (killing or abandonment of eggs or young) is considered a "take", and such a take would violate the Migratory Bird Treaty Act. Passerines (songbirds) and non-passerine land birds are protected under the federal Migratory Bird Treaty Act.

Mitigation Measures

The following mitigation measure is recommended for the Project to avoid adverse effects on nesting birds

Mitigation Measure Biology-1: Protect Nesting Birds. During construction of the Project, the removal of any trees and demolition of the existing buildings shall occur between September 1 and January 31. Tree removal and building demolition should be avoided from February 1 to August 31, which is the typical migratory bird's nesting period in this part of California. If no vegetation removal or building demolition is proposed during the nesting period, then no surveys are required.

1. If tree removal must occur during the bird breeding season, all trees to be removed shall be surveyed by a qualified biologist to verify the presence or absence of nesting raptors or other birds. Pre-removal surveys shall be conducted within 15 days prior to the start of work.
2. If the survey indicates the potential presence of nesting raptors or other birds, the biologist shall determine an appropriately sized buffer around the nest in which no work will be allowed until the young have successfully fledged. The size of the nest buffer will be determined by the biologist in consultation with the California Department of Fish and Wildlife, and will be based largely on the nesting species and its sensitivity to disturbance. In general, buffer sizes of 200 feet for raptors and 50 feet for other birds should suffice to prevent disturbance to birds nesting in the urban environment, but these buffers may be increased or decreased, as appropriate, depending on the bird species and the level of disturbance anticipated near the nest.

Resulting Level of Significance

With implementation of mitigation measure Biology-1, which requires a nesting survey close to initiation of construction activities, the Project's impacts on nesting birds would be reduced to a level of less than significant.

Conflict with Local Policies Protecting Biological Resources (Tree Ordinance)

There are seven street trees that are located on the Project site's frontage along Union Street, all of which appear to be big-leaf maples. The Project proposes to retain the two trees nearest to 10th Street and the one tree nearest to Wade Johnson Park, but to remove the four trees in the center of the block to accommodate new construction (see **Figure 12**).

Regulatory Requirements

The City's Tree Protection Ordinance (OMC Chapter 12.36) provides that, "it is in the interest of the public health, safety and welfare of the Oakland community to: 1) protect and preserve trees by regulating their removal; 2) prevent unnecessary tree loss and minimize environmental damage from improper tree removal; 3) encourage appropriate tree replacement plantings; 4) effectively enforce tree preservation regulations; and 5) promote the appreciation and understanding of trees". Accordingly, the Project will be subject to the following provisions of the OMC:

Regulatory Requirement Biology-1, Compliance with Tree Protection Ordinance: The Project will be required to obtain a tree permit from the City of Oakland for the removal of four trees from the Project's frontage along Union Street, and to abide by the conditions of that permit. Standard conditions that apply to the City's tree permit include the following:

1. Adequate protection shall be provided during the construction period for any trees which are to remain standing, including the following, plus any recommendations of an arborist
2. Replacement tree plantings shall be required for tree removals for the purposes of erosion control, groundwater replenishment, visual screening, wildlife habitat, and preventing excessive loss of shade
3. No tree replacement shall be required for the removal of nonnative species, for the removal of trees which is required for the benefit of remaining trees, or where insufficient planting area exists for a mature tree of the species being considered.

The Big Leaf maple (acer macrophyllum) is native to western North America, mostly near the Pacific coast, from southernmost Alaska south to southern California. Therefore, pursuant to the City's Tree Ordinance, replacement plantings for removal of these native trees would be required. The Project proposes to plant as many as 57 new trees as part of its landscape plans, including 9 Trident maples (acer buergerianum) and 2 Japanese maples (acer palmatum), more than fulfilling the City Tree Ordinance requirements for tree replacement plantings. Accordingly, the Project would not conflict with the local City of Oakland Tree Preservation Ordinance or policy, and this impact would be less than significant.

Conflict with Habitat Conservation Plans

There are no adopted Habitat Conservation Plans, Natural Community Conservation Plans or other approved local, regional or state habitat conservation plans that are applicable to the site or the surrounding area. Therefore, the Project would not conflict with any such habitat conservation plans and no impact would occur.

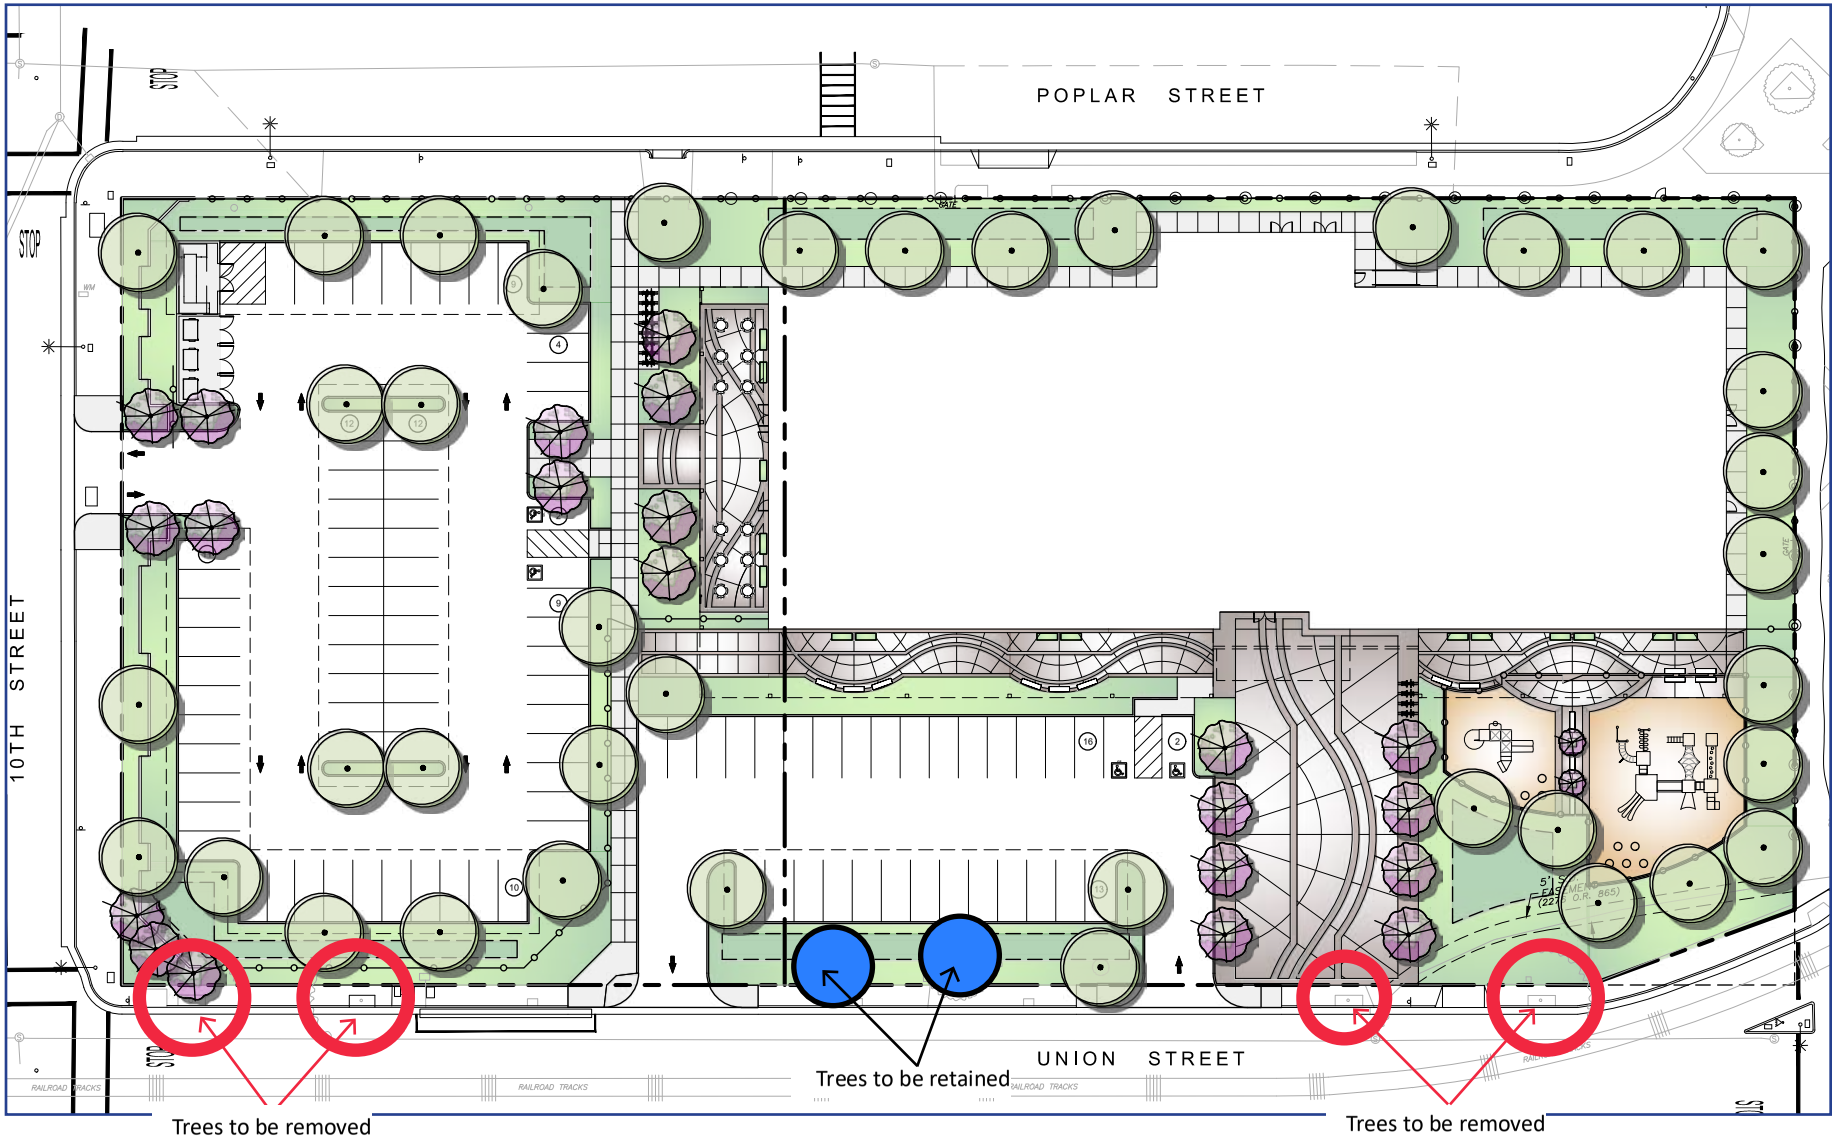

Figure 12
Proposed Tree Removal

Cultural Resources

Would the Project:	Significant Impact	Less Than Significant With Mitigation	Less Than Significant	No Impact
a) Cause a substantial adverse change in the significance of a historical resource pursuant to Public Resources Code Section 15064.5?	❒	❒	■	❒
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Public Resources Code Section 15064.5?	❒	❒	■	❒
c) Disturb any human remains, including those interred outside of formal cemeteries?	❒	❒	■	❒

Historical Resources

Information for this section of the Initial Study has been derived from the following primary source:

- Page & Turnbull, *Cole Middle School 1011 Union Street, Historic Resource Evaluation (HRE)*, December 23, 2019 (**Appendix B**)

The 2019 HRE evaluated the two educational buildings that were situated within the property: the existing classroom building (Cole School) originally constructed in 1925 and renovated 1936; and the now-removed cafeteria building constructed in 1949. The HRE did not address the former ancillary building at the northeast corner of the site, which was a modular structure built in 2011 and also now removed. The HRA was prepared based on research collected at various local repositories including the Alameda County Office of the Clerk-Recorder, the City of Oakland Building Department and Oakland Public Library History Room, as well as various online sources including California Digital Newspaper Collection, Newspapers.com, and the David Rumsey Map Collection. Key primary sources consulted and cited in this report include Sanborn Map Company fire insurance maps, historic newspapers, building permit applications, city directories, and historic building plans provided by OUSD. In October 2019, a site visit was conducted, complete with architectural photography and field notes.

Historic Setting

The existing Cole School stands on a site that was acquired by the City of Oakland's Board of Education in 1875. Between 1877 and 1880, the original Cole Grammar School Building was built at the site. The original school was a two-story, Gothic Revival style building with a hipped roof and tall narrow windows. The school was named in honor of Rector E. Cole, a prominent dentist and City Council member who was, at the time of the school's founding, president of the Oakland Board of Education. The Cole Grammar School educated numerous children, perhaps most notably the famed author, Jack London. In late December 1923, the original Cole Grammar School building was destroyed by arson.

Between 1924 and 1925, the first iteration of the existing Cole School building was designed and constructed. The cornerstone for the Cole School building that currently stands at the property was laid in May 1925. This first iteration of the existing Cole Building was a Late Gothic Revival design, with a brick exterior and cast cement exterior ornamentation, across a U-shaped plan. However, in March of 1926 the nearly complete building was rejected by the Superintendent of Buildings and Grounds for failure to comply with material specifications.

In 1936, the school was renovated with its current Moderne style exterior.[18] Plans for this renovation were prepared under the supervision of architect and engineering consultant William G. Corlett. Exterior brick and cast concrete ornamentation and window mullions were removed and replaced with cement plaster exterior surfaces and wood, respectively.

In 1949, the Cafeteria building was designed by Oakland-based architect, Edward O. Blodgett. The one-story, hybrid reinforced concrete and wood-frame building was described as a new "wing" to the Cole School when it was dedicated in March of 1950. The Cafeteria building was also designed to house the school's music program, and had one additional classroom and an overall capacity for 214 students.

In 1973, the Cole School was closed for renovation, and it appears to have remained closed until 1975. During this time, the exterior staircases and elevator at the rear wings of the building were constructed. By 1980, 12th Street was closed between Union and Poplar Streets, and replaced with green space. The Cole School converted from its original use as an elementary school to that of a middle school in 1980, and continued to operate as such until 2009, when it was closed as a school. The building began its last use housing administrative offices for OUSD and the OUSD Police Unit.

Historic Status

The following section examines the national, state and local historical ratings currently assigned to the property at 1011 Union Street.

- 1011 Union Street is not currently listed in the National Register of Historic Places.
- 1011 Union Street is not currently listed in the California Register of Historical Resources.
- Cole School is listed in the California Historic Resources Information System (CHRIS) database with a Status Code of 6Z (found ineligible for National Register, California Register or Local designation through survey evaluation). The 6Z status relates to a survey and evaluation undertaken in 1990. The most recent update to the CHRIS database for Alameda County that lists this status codes was in 2011.
- 1011 Union Street was documented by the Oakland Cultural Heritage Survey (OCHS) in 1990, and was assigned an OCHS rating of "C3". This rating indicates the property is of secondary importance (representative architecture example) and is not located within a historic district. 1011 Union Street is not a City of Oakland Landmark and is not currently listed in the Local Register.

Historic Re-Evaluation

The HRE assessed the Cole School classroom building and the cafeteria at the Cole Middle School campus (1011 Union Street) to determine if these building may qualify as eligible historic resources for purposes of review under CEQA. Using the City of Oakland criteria, an historical resource under CEQA is defined as a resource that meets any of the following criteria:

- A resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR)

[18] The Moderne style, also referred to as Art Moderne and Streamline Moderne, is a late Art Deco architecture style that appeared in commercial buildings, public buildings, theaters, gas stations, and residential buildings between 1930 and 1950. It emerged in Germany in the work of the New Objectivity artists and in the buildings by architects involved in the German Werkbund, led by Hermann Muthesius. Taking cues from the Werkbund, American designers were similarly interested to strip Art Deco of its excessive ornamentation and focus on its streamlined aesthetic, especially during the Great Depression in the 1930s.

- A resource that meets the criteria for listing on the CRHR
- A resource included in Oakland's Local Register of historical resources, unless the preponderance of evidence demonstrates that it is not historically or culturally significant
- A resource identified as significant (e.g., rated 1-5) in a historical resource survey recorded on Department of Parks and Recreation Form 523, unless the preponderance of evidence demonstrates that it is not historically or culturally significant, or
- A resource that is determined by the Oakland City Council to be historically or culturally significant, even though it does not meet the other four criteria listed above

In order for a property to be eligible for listing in the California Register, it must be found significant under one or more of the following criteria.

- *Criterion 1 (Events)*: Resources that are associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.
- *Criterion 2 (Persons)*: Resources that are associated with the lives of persons important to local, California, or national history.
- *Criterion 3 (Architecture)*: Resources that embody the distinctive characteristics of a type, period, region or method of construction, or which represents the work of a master, or possess high artistic value.
- *Criterion 4 (Information Potential)*: Resources or sites that have yielded or have the potential to yield information important to the prehistory or history of the local area, California, or the nation

Criterion 1 (Events)

The Cole School property at 1011 Union Street in West Oakland does not appear to be individually eligible under Criterion 1 (Events), as the property is not associated with significant events nor does it appear to have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States. The buildings do not date to the earliest school development of the property in 1875. Rather, these buildings reflect the widespread changes in the design of educational buildings that took place in the 1930s in association with the Field Act of 1933, which resulted in reconstruction or heavy alteration of many schools throughout the State to meet updated seismic safety standards. The existing Cole School building is not known to have been the location of any singular events with significance to the history of Oakland, the State or the nation. The Cafeteria was designed and built as a secondary or supplementary building within the campus. Research did not find information to support a finding of significance under this criterion.

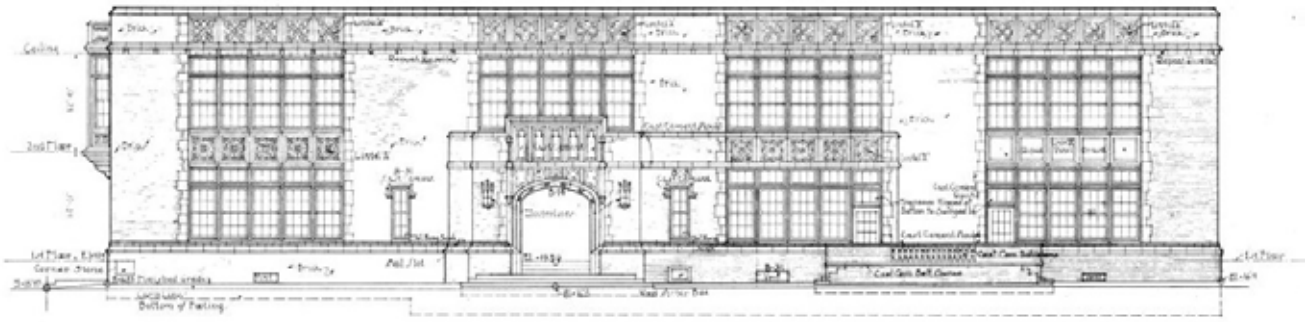
Criterion 2 (Persons)

1011 Union Street does not appear to be individually eligible under Criterion 2 (Persons). The original Cole Grammar School (non-extant) was named for a prominent Oakland dentist and president of the Board of Education, Rector E. Cole. Although the school's name carried on after the destruction of the original school building in 1923, the existing building and property do not bear significant association to Cole. They do not represent Cole's achievements in dentistry or as a member of the Board of Education, and were built after Cole's professional, productive life occurred. The school's notoriety as having been Jack London's elementary school is not reflected by the existing buildings and property, which were developed after London attended the Cole Grammar School.

Criterion 3 (Architecture)

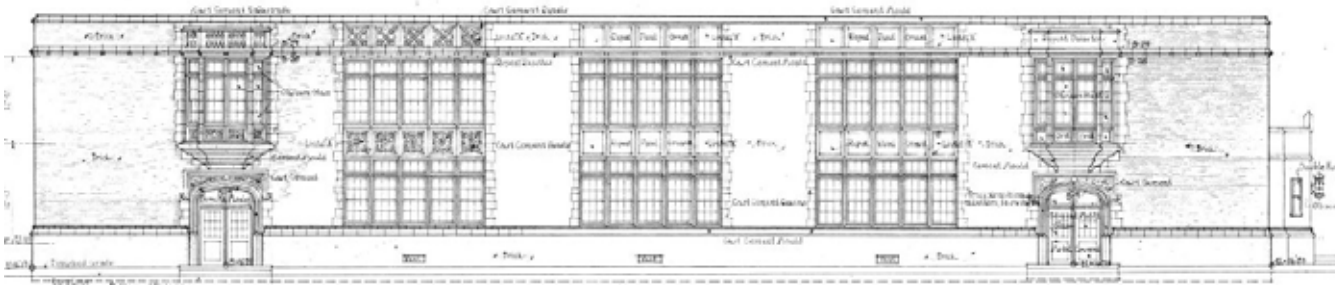
1011 Union Street does not appear to be individually eligible under Criterion 3 (Architecture). The subject property was originally developed in 1879-1880 with a two-story, Gothic Revival style school building, which stood at the site and operated as the Cole Grammar School until it was destroyed by fire in 1923. In 1925, the existing building known as the Cole School was built with a Late Gothic Revival style aesthetic (**see Figure 13**), but suffered from material deficiencies.

After the passing of the Field Act of 1933, the school building was heavily renovated and restyled in the then emergent Moderne aesthetic by noted Oakland-based architect and engineer William G. Corlett, who served contemporaneously as a consulting design professional to the City's Board of Education. Corlett's association to the Cole School's alterations is notable. However, the building does not appear to be among the most important works of his career, which included other City of Oakland public school buildings and several prominent institutional buildings across the Bay Area region. The Cole School does not bear the same strength of association with Corlett's career as buildings that were designed in their entirety by Corlett. Rather, the Cole School building represents Corlett's role in redesigning a pre-existing work of architecture (see **Figure 14**).



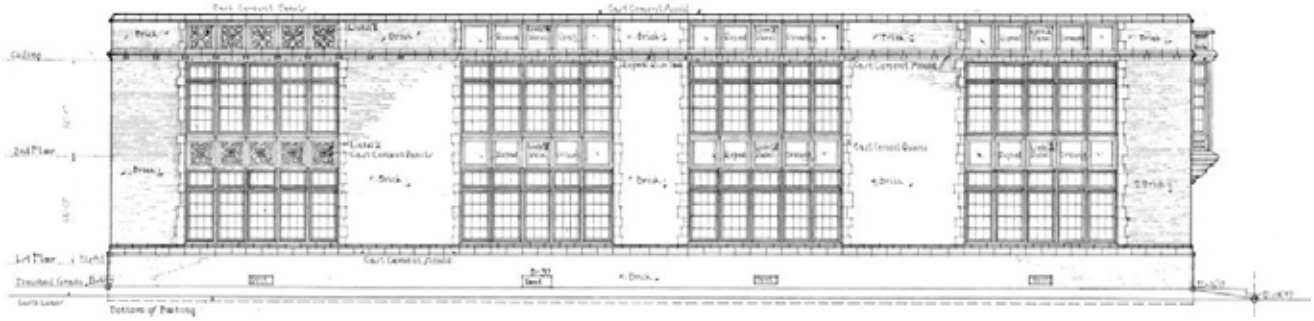
The Cole School building embodies the horizontal emphasis and massing commonly seen in Moderne style buildings ca. 1936 and features a modest exterior material palette and limited ornamentation. The building lacks the fusion of curvilinear forms across its massing, such as curved bays and corners that would enable it to stand out as a very strong local representation of the style's application to an education building. Rather, the Cole School is an application of the Moderne style to a pre-existing, formerly Late Gothic Revival school. The building's fenestration pattern largely reflects its original design, despite alterations, but does not stand out as a particularly important example of an education building designed in 1925, and renovated and restyled in 1936.

The Cafeteria building was designed in 1949 by Oakland-based architect Edward O. Blodgett, who served as draftsman and architect for the City of Oakland's Board of Education between 1934 and 1949, after having worked with William G. Corlett and Walter Reed of Reed & Corlett as a draftsman. The Cafeteria building was designed in a modest, modern form that communicated the building's use as an educational building more so than a particular architectural style. The building did not have characteristics that enabled it to stand out as an individually distinct example of an education building constructed in 1949 in Oakland.



Overall, the one remaining age-eligible building within the former Cole School property, and the site as a whole, does not stand out as individually significant entities under this criterion.

Criterion 4 (Information Potential)



The "potential to yield information important to the prehistory or history of California" typically relates to archeological resources, rather than built resources. When California Register Criterion 4 (Information Potential) does relate to built resources, it is for cases when the building itself is the principal source of important construction-related information. The subject property does not appear to feature construction or material types, or embody engineering practices that, with additional study, would provide important information.

Potential Impacts

Neither the Cole School building or the former Cafeteria are listed in, nor do they appear to be eligible for the California Register. The subject property does not meet either of these criteria of the City of Oakland's definition of historical resources under CEQA. The Oakland General Plan Historic Preservation Element (HPE) defines the criteria for significance that must be met by a resource for it to be considered for listing in the Oakland Local Register of Historical Resources (Local Register), and would therefore be considered a historical resource under CEQA. According to the HPE and for purposes of environmental review under CEQA, those properties meeting the following criteria constitute the City of Oakland's Local Register:

- All Designated Historic Properties, including Oakland Landmarks, S-7 and S-20 Preservation Districts, and Preservation Study List properties, and
- Those Potential Designated Historic Properties (PDHPs) that have an existing rating of "A" or "B", or are located within an Area of Primary Importance

The property is not currently listed on Oakland's Local Register, and was previously assigned an individual property rating of "C3" by the OCHS in 1990. The Individual Property Rating indicated the building appeared to be of secondary importance and is not located within a historic district or Area of Primary or Secondary Importance.

The HRE evaluation finds that the OCHS rating of "C3" remains applicable to the subject property. This rating would not qualify the property for listing in Oakland's Local Register. Unless found uniquely significant to Oakland's history by City Council, preliminary review of the subject property indicates that it is unlikely to meet the requisite criteria to attain the status of historical resource under CEQA. Based on the conclusions of the Page & Turnbull HRE (see full report as Appendix B), development of the Project would not cause a substantial adverse change to an eligible historic resource, and the potential for direct or indirect impacts on historic resources would be less than significant.

Mitigation Measures

None needed

Archaeological Resources and Human Remains

Information for this section of the Initial Study has been derived from the following primary source:

- PaleoWest Archaeology, *Archaeological Desktop Review in Support of the Central Administration Center at Cole Campus Project, Alameda County, California*, March 2020 (**Appendix C**)

The Project site in urbanized Oakland has been developed and in active use as a public school since the 1870s. The site is surrounded by other urban development. The cultural resources investigation conducted for the Project included a cultural resource literature and records search conducted at the Northwest Information Center (NWIC), and a Sacred Lands File search through the Native American Heritage Commission (NAHC). The records search results indicate that no cultural resources have been previously recorded within the Project area.

The NWIC records search did identify 62 previously conducted cultural resource studies conducted within a 0.25-mile radius of the Project site, including one previous study covering the Project site. The NWIC records search identified 22 cultural resources that were discovered during these previous studies. All of the cultural resources reported within the ¼-mile buffer of the Project area (except 1), are sites of residential and commercial buildings that date from the late 19th century to the mid-20th century. The one exception is a prehistoric deposit site that was found during the construction of the Mandela Gateway project. The prehistoric deposit contained midden comprised of a dense quantity of shell, few faunal fragments and few charcoal chunks, interpreted as a likely a food-processing site

associated with an unknown nearby habitation deposit. The one previous study that did cross the Project area did not reveal any known cultural resources.

The entirety of the Project site is covered with either buildings or asphalt, and no test borings or shovel pits were conducted pursuant to the archaeological review.

Potential Impacts

Construction-related subsurface disturbance of the Project site could potentially damage or destroy previously unidentified prehistoric archaeological resources. Ground disturbing activities associated with construction activities in the Project area could also disturb previously unknown human remains, including those interred outside of formal cemeteries. The potential to uncover Native American human remains exists in locations throughout California. Although not anticipated, human remains may be discovered during site-preparation and grading activities. In the event of an inadvertent discovery of archaeological resources and/or human remains during ground-disturbing activities, such a discovery would be considered a potentially significant impact.

Mitigation Measures

To address the potential for discovery of archaeological resources or human remains during construction, and to minimize potential risks to such resources if discovered during Project construction, the following mitigation measures are recommended:

Mitigation Measure Cultural-1: Survey of the Project Area. An archaeologist should conduct a pedestrian archaeological survey of the Project area after building demolition and asphalt removal, and after soil excavation. Any newly discovered historic (over 45 years of age) or prehistoric archaeological sites identified during the survey must be recorded, as required, on appropriate Department of Parks and Recreation Primary Record (DPR 523) and associated (e.g., Building-Structure-Object) forms.

Mitigation Measure Cultural-2: Inadvertent Discoveries. If any previously unknown prehistoric resources are discovered during grading, trenching, or other on-site excavation(s), then earthwork within 25 feet of these materials shall be stopped until a qualified professional archaeologist has evaluated the potential significance of the find, and suggests appropriate steps to protect the resource.

1. According to CEQA Section 15126.4, avoidance is the preferred mitigation. Since CEQA provisions regarding the preservation of historic resources direct that adverse effects to historic resources shall be avoided, if feasible, the resource shall be protected from damaging effects through avoidance.

2. If avoidance of any previously undiscovered archaeological site is not feasible, data recovery shall be conducted in accordance with an approved Archaeological Data Recovery Plan (ADRP) to mitigate adverse effects to the significance of the site – the area of data recovery being limited to the area of adverse effect. This would fulfill CEQA requirements that the mitigation measure must be "roughly proportional" to the impacts of the project. A professional, qualified archaeologist shall conduct data recovery in compliance with CEQA Guideline Section §15064.5. Once the site has been properly tested, subject to data recovery, or preserved to the satisfaction of the professional archaeologist in compliance with CEQA Guideline §15064.5, the site can be further developed.

Mitigation Measure Cultural-3: Inadvertent Discovery of Human Remains. Section 7050.5(b) of the California Health and Safety code will be implemented in the event that human remains, or possible human remains, are located during Project-related construction excavation. Section 7050.5(b) states, "In the event of discovery or recognition of any human remains in any location other than a

dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code."

1. The County Coroner, upon recognizing the remains as being of Native American origin, is responsible to contact the NAHC within 24 hours. The NAHC has various powers and duties, including the appointment of a Most Likely Descendant (MLD) to the Project. The MLD, or in lieu of the MLD, the NAHC, has the responsibility to provide guidance as to the ultimate disposition of any Native American remains.

Resulting Level of Significance

With required implementation of Mitigation Measures Cultural-1 through Cultural-3, potential adverse effects on as-yet undiscovered archaeological resources or human remains would be less than significant.

Energy

Would the Project:	Potentially Significant	Less Than Significant With Mitigation	Less Than Significant	No Impact
a) Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	❒	❒	■	❒
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	❒	❒	■	❒

Energy Use and Efficiency

Construction and operation of the Project would result in the consumption of fuel and energy resources for construction vehicles and equipment during construction, for vehicles accessing the site during operations, and for heating, lighting and other electrical needs during operations. The Project has been designed to meet and exceed applicable performance measures for energy efficiency as described by the Collaborative for High Performance Schools (CA-CHPS). CA-CHPS is a collaboration of California's major utilities to address energy efficiency in schools. CHPS addresses all aspects of school design, construction and operation, and is a nationally recognized evaluative tool for measuring high-performance school buildings. The CA-CHPS provides California-specific criteria for defining high performance schools, and addresses topics of integration, indoor environmental quality, energy, water, site, materials and waste management, and operations metrics.

Based on the CA-CHPS Worksheet prepared by the District for the Administrative/Education Center building at Cole (see **Appendix D**), the Project's design and operational plans achieve a total of 112 points out of a possible 250 points.[19] This point rating exceeds the CA-CHPS criteria for a CHPS Designed/Verified non-classroom building (at 83 points), and achieving all CA-CHPS pre-requisite criteria as well as all CalGreen/Title 24 measures for energy efficiency and incorporation of energy-conserving design and construction. The Project would comply with all applicable regulations and energy standards, and its use of energy would not be wasteful, inefficient, or unnecessary. The Project's impact related to energy resources would be less than significant.

[19] Shah Kawasaki Architects, CHPS Scorecard, Sheet A-005 of Central Administration Center at Cole Campus submittal to State Architects, February 19, 2021

Geology and Soils

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42)	❒	❒	■	❒
ii) Strong seismic ground shaking?	❒	■	❒	❒
iii) Seismic-related ground failure, including liquefaction?	❒	❒	■	❒
iv) Landslides?	❒	❒	❒	■
b) Result in substantial soil erosion or the loss of topsoil, creating substantial risks to life, property, or creek/waterways?	❒	■	❒	❒
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	❒	❒	■	❒
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	❒	❒	■	❒
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	❒	❒	❒	■
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	❒	❒	■	❒

Information supporting the following section of this Initial Study has been derived from the following primary source:

- Consolidated Engineering Laboratories, "*Geotechnical Engineering and Geologic Hazards Study for the Cole Campus Central Administrative Center*", as revised September 25, 2020 (**Appendix E**)

This geotechnical and geologic report has been reviewed by the California Natural Resources Agency's Department of Conservation, California Geological Survey, and the California Geological Survey has already concluded that, "the engineering geology and seismology issues at this site are adequately assessed in the referenced report, and no further information is requested." This conclusion is documented in the California Geological Survey letter, *Second Engineering Geology and Seismology Review for Central Administrative Center at Cole Campus – New Buildings*, October 2, 2020 (**Appendix F**).

The Consolidated Engineering Laboratories' Geotechnical Engineering and Geologic Hazards Study (CEL Geology Study) for the Project includes a review of all pertinent geologic and geotechnical literature pertaining to the site. This includes publications and maps issued by the United States Geological Survey (USGS), California Geological Survey (CGS), United States Department of Agriculture (USDA), Federal Emergency Management Agency (FEMA), water agencies and other government agencies. In order to characterize the subsurface conditions beneath the proposed improvement areas, a field exploration program was conducted at the site in November 2019 and May 2020. That field exploration program consisted of a combination of five drilled test borings and four Cone Penetration Tests (CPT) to supplement two borings previously drilled at the site. Laboratory tests were performed on select samples to determine some of the physical and engineering properties of the subsurface soils. The results of the laboratory testing are also included in Appendix F.

Fault Rupture

The State of California adopted the Alquist-Priolo Earthquake Fault Zone Act of 1972 (Chapter 7.5, Division 2, Sections 2621 – 2630, California Public Resources Code), which regulates development near active faults for the purpose of preventing surface fault rupture hazards to structures for human occupancy. In accordance with the Alquist-Priolo Act, the California Geological Survey established boundary zones or "Earthquake Fault Zones", surrounding faults or fault segments judged as sufficiently active, well defined and mapped for some distance. These zones generally extend at least 500 feet on each side of a mapped or inferred trace of an active fault. Structures for human occupancy within designated Earthquake Fault Zone boundaries are not permitted unless surface fault rupture and fault creep hazards are adequately addressed in a site-specific evaluation of the development site.

The Project site is not currently within a designated Earthquake Fault Zone as defined by the State. The closest Earthquake Fault Zone is that of the Hayward Fault, which is located about four miles east of the site. The CEL Geology Study concludes that, "since the site is not within an Earthquake Fault Zone and no faults are known to be present that are within or toward the Project site, the potential for fault ground rupture and surface manifestations from fault creep is judged to be very low to nil", (i.e., less than significant).

Seismic Shaking

The Project site is located in a seismically active region dominated by major faults of the San Andreas Fault System. Major active faults include the San Andreas Fault and the Hayward Fault (located approximately 4 miles northeast of the site). Other major active faults include the Calaveras Fault (located on the order of 14 miles northeast of the site), the Concord- Green Valley Fault (located on the order of 18 miles northeast of the site), and the San Gregorio Fault (estimated to be on the order of 23 miles southwest of the site). The CEL Geology Study concludes that, "the site may experience strong to severe ground shaking from a major earthquake originating from these major Bay Area faults". This is considered a potentially significant impact.

Regulatory Requirements and Mitigation Measures

Regulatory Requirement Geology-1, California Building Code: Because the Project site is located within a seismically active region, the building design and construction must consider the effects of seismic activity in accordance with the latest (2019) edition of the California Building Code (CBC). The building design has already been reviewed by the California State Architect and the California Geologic Survey, and those agencies have determined that the engineering geology and seismology issues at this site are adequately assessed, and no further information is requested.

The CEL Geology Study concludes that the Project site is considered geologically and geo-technically suitable for the Project, provided the Study's recommendations are incorporated into the design and

implemented during construction. The CEL Geology Study provides the following recommendations, included as mitigation measures for this Initial Study, to address seismic shaking:

Mitigation Measure Geology-2, Seismic Design Parameters: According to the CEL Geology Study, the Project should be designed in accordance with local design practice to resist the lateral forces generated by ground shaking associated with a major earthquake occurring within the greater San Francisco Bay region. Based on the measured shear wave velocity at the site, CEL has estimated average shear wave velocity of 300 meter/second, and classified the site as Site Class "D". For design of the site structures in accordance with the seismic provisions of the CBC 2019 and American Society of Civil Engineers (ASCE) 7-16, the following design seismic ground motion values are recommended.

1. Mapped Spectral Response Accelerations: Short Period - 1.592 g, and 1-second Period - 0.6 g
2. Adjusted Maximum Spectral Response Accelerations: Short Period - 1.778 g, and 1-second Period - 1.650 g
3. Design Spectral Response Accelerations: Short Period - 1.185 g, and 1-second Period - 1.100 g
4. Site-Specific Peak Ground Acceleration (PGA): 0.700 g

Mitigation Measure Geology-3, Utility Penetrations at Building Perimeter: Flexible connections at building perimeters should be considered for utility lines going through perimeter foundations. This would provide flexibility during a seismic event. This could be provided by special flexible connections, pipe sleeving with appropriate waterproofing, or other methods.

Resulting Level of Significance

These seismic design parameters and recommendations have been reviewed and accepted by the California Geological Survey as appropriate for the Project, and the Project's seismic design pursuant to these parameters has been reviewed and approved by the California Division of the State Architect. With construction of the Project as recommended, designed and approved, the hazards associated with seismic shaking will be reduced to levels considered acceptable by professional geotechnical engineers and State regulations, and thus would mitigate this impact to less than significant.

Liquefaction

The Project site has been mapped as within a Seismic Hazard Zone for liquefaction based on the State of California, Official Map of the Oakland West Quadrangle, 2003. The soils encountered below the water table at the Project site include layers of dense to very dense sand that may be susceptible to liquefaction in response to strong ground shaking.

The CEL Geology Study included a detailed analysis for liquefaction settlement using software, calculations and procedures and as recommended by CGS. Based on that analysis, the CEL Geology Study finds that seismically induced settlements at the Project site due to the design earthquake may potentially range between approximately ⅓ to ¾ inch, with differential settlements across the site generally considered ½ to ⅔ the maximum estimated total seismic settlement value. These settlements were calculated to occur in discontinuous layers primarily between depth intervals of 15 to 18 feet. The CEL Geology Study assumes a 1-meter-thick liquefiable zone overlain by 5 meters of non-liquefiable materials, and finds that, "the calculated values of potential liquefaction settlement would not result in significant surface manifestation, and that significant post-seismic reduction in the bearing capacities of the existing overlying soils would not occur", (i.e., would be less than significant).

Dynamic Compaction

Dynamic compaction is a phenomenon where loose, sandy soil located above the water table densified from vibratory loading, typically from seismic shaking or vibratory equipment. The Project site is generally underlain by layers of medium dense to very dense silty to clayey sand. Based on the CEL Geology Study evaluation of the composition, measured density and strength of the soils encountered above the historic high ground-water table depth in the borings, "potential dynamic settlements for the design seismic event are anticipated to be less than 0.1 inch", (i.e., would be less than significant).

Lateral Spreading

Lateral spreading involves both vertical and lateral ground movement, resulting from liquefaction. In addition to liquefaction, a free face or slope is necessary in most cases for lateral spreading to occur. Lateral spreading can occur on relatively flat sites with slopes less than two percent under certain circumstances, and manifest itself at the ground surface in the form of cracking and settlement. Lateral spreading can occur in areas located within close proximity to an open face which are supported by underlying liquefiable soil under or close to the open face. Under a lateral spreading condition, soils which liquefy lose strength and the slope moves towards the open face. Any structures or improvements located within close proximity to the slope can also move and possibly be destabilized.

No significant free slope faces are present within the general vicinity of the Project site. In addition, no significant continuous liquefiable subsurface layers underlying the site were identified in the explorations. Therefore, the CEL Geology Study concludes that, "the potential for the occurrence of lateral spreading effects (i.e., surface cracking, settlement) significant enough to structurally impact the new buildings is very low to nil", (i.e., less than significant)

Landsliding

Landslides can occur under a variety of loading conditions, including both static and seismic, but involve sloping ground. The Project site is not within a zone of seismically induced landslide investigation. The site and immediate vicinity are relatively flat, covered by urban development, and do not exhibit landslide features as determined by the CEL Geology Study's site reconnaissance and literature review. Therefore, "the site is not considered susceptible to landsliding", (i.e., no impact).

Soil Erosion

Development of the Project would involve construction activities (e.g., grading) on an approximately 2.6-acre site, resulting in the potential for erosion and sedimentation of downstream receiving waters.

Long-term erosion at the site will be reduced by landscaping and hardscape areas, such as parking lots and walkways, designed with appropriate surface drainage facilities.

Regulatory Requirements

The CEL Geology Study states that present construction techniques and agency requirements have provisions to limit soil erosion and resultant siltation during construction. These measures will reduce the potential for soil erosion at the site during the various construction phases. Erosion control standards are set by the Regional Water Quality Control Board (RWQCB) and administered through the National Pollutant Discharge Elimination System (NPDES) permit process. The following measures and will be required of the Project pursuant to these permit regulations:

Regulatory Requirement Geology-4, Notice of Intent: The project applicant shall submit a Notice of Intent (NOI) to comply with the requirements of the Construction General Permit issued by the State Water Resources Control Board (SWRCB)

Regulatory Requirement Geology-5, Stormwater Pollution Prevention Plan: Pursuant to the Construction General Permit, the project applicant shall prepare and implement during construction a Stormwater Pollution Prevention Plan (SWPPP), including Best Management Practices (BMPs) to reduce erosion, sedimentation and water quality impacts during construction to the maximum extent practicable.

The Project will be required to comply with these regulatory and permit requirements related to erosion control, which will reduce impacts related to soil erosion to levels of less than significant.

Settlement Due to Consolidation

Consolidation is the densification of soil into a more dense arrangement from additional loading, such as new fills or foundations. Consolidation of clayey soils is usually a long-term process, whereby the water is squeezed out of the soil matrix with time. Sandy soils consolidate relatively rapidly with an introduction of a load. Consolidation of soft and loose soil layers and lenses can cause settlement of the ground surface or buildings. The CEL Geology Study concludes that, "the subsurface soils are primarily granular, so are not considered to be susceptible to long-term consolidation settlement. However, the uppermost four feet underlying the site consists of loose sands which may be susceptible to immediate compression settlement due to imposed footing loads, as well as minor settlement due to earthquake shaking."

Mitigation Measures

The CEL Geology Study finds that immediate compression settlements of near surface loose sandy soils can be controlled by limiting the magnitude of building loads, or minimized by either deepening the building foundations to bear on denser underlying soils or by reworking loose soils under footings as compacted, engineered fill. The CEL Geology Study provides the following recommendations, included as mitigation measures for this Initial Study, to address consolidation/densification of soils.

Mitigation Measure Geology-6, Project Compaction Recommendations: The Project's grading plans should follow all recommended compaction requirements as presented in Table 6 of the CEL Geology Study.

Mitigation Measure Geology-7, Building Pad Grading. To reduce potential abrupt differential settlement of the near surface soils as well as to provide uniform bearing support, the buildings should be supported by a layer of reworked, engineered fill. The fill layer should extend to at least four feet below existing ground surface. It should be constructed by a combination of over-excavating the pad below the existing grade, scarifying the over-excavation subgrade to a depth of at least eight inches, and compacting the exposed surface to the project compaction requirements, and backfilling with compacted, engineered fill to the new building pad subgrades. Therefore, the scarified fill thickness can be considered part of the required minimum four-foot engineered fill thickness. The engineered fill layer should extend at least five feet horizontally beyond the perimeter of the building footprints or as feasible if limited by nearby structures.

1. Engineered fill should be placed and compacted to final pad subgrade in accordance with the detailed recommendations presented in the CEL Geology Study.
2. Due to the granular nature of the near-surface materials, excavating the edges of the over-excavations may require that slopes be cut back, as near-vertical slopes may not stand beyond the short-term.

Mitigation Measure Geology-7, Shallow Foundations: The proposed buildings can be supported on conventional continuous perimeter and interior spread footings bearing on the recommended engineered fill layer. Footings should have a minimum width of 18 inches and founded on a minimum of 24 inches below lowest adjacent finished grade (i.e., pad subgrade for interior continuous footings, exterior compacted surface grade for exterior footings, not including loose landscape or topsoil material).

Mitigation Measure Geology-8, Grading Flatwork/Pavement Areas: Areas to receive concrete hardscape or pavements should be scarified to a minimum depth of eight inches below existing grade or final subgrade, whichever is lower. Scarified areas should be moisture conditioned and compacted. Where required, engineered fill should be placed and compacted to reach design subgrade elevation. Rubber-tired heavy equipment, such as a full water truck, should be used to proof load exposed subgrade areas where pumping is suspected. Proof loading will determine if the subgrade soil is capable of supporting construction equipment without excessive pumping or rutting.

Resulting Level of Significance

These soil compaction parameters and recommendations have been reviewed and accepted by the California Geological Survey as appropriate for the Project, and the Project's design pursuant to these parameters has been reviewed and approved by the California Division of the State Architect. With construction of the Project as recommended, designed and approved, the hazards associated with compression and settlements of near surface soils will be reduced to levels considered acceptable by professional geotechnical engineers, and thus would mitigate this impact to less than significant.

Expansive and Collapsible Soils

Collapsible soils are fine sandy and silty soils that have been laid down by the action of flowing water, usually in alluvial fan deposits. Terrace deposits and fluvial deposits can also contain collapsible soil deposits. The soil particles are usually bound together with a mineral precipitate. The loose structure is maintained in the soil until a load is imposed on the soil and water is introduced. The water breaks down the inter-particle bonds and the newly imposed loading densifies the soil.

Subsurface deposits encountered during the drilling program conducted by CEL generally consisted of moist to wet, medium dense to very dense clayey to silty sand. Visual observation of selective samples of the near-surface soils indicated the soils to be of low plasticity, and the near-surface soils are considered to be generally of very low expansion potential. In addition, the soil did not show visual evidence of collapse potential.

Mitigation Measures

The CEL Geology Study finds the potential for collapsible soils underlying the site to be low. The CEL Geology Study provides the following recommendations, included as mitigation measures for this Initial Study, to address the potential for collapsible soils:

Mitigation Measure Geology-9, Interior Floor Slabs: Surficial onsite materials appears low to non-plastic; therefore, a non-expansive fill layer is not required for the proposed building. Slab reinforcing as well as slab construction joints should be designed by the structural engineer or slab

designer to satisfy the anticipated use and loading of the slab. Slab-on-grade subgrade surfaces should be proof-rolled to provide a smooth, unyielding surface for slab support.

Mitigation Measure Geology-10, Positive Drainage: Final grading should be designed to provide drainage away from structures and the top of slopes.

1. Soil areas within 10 feet of proposed structures should slope at a minimum of 5% away from the buildings.
2. Adjacent concrete hardscape should slope a minimum 2% away from the buildings.
3. Roof leaders and downspouts should not discharge into landscape areas adjacent to buildings, and should discharge onto paved surfaces sloping away from the structures or into a closed pipe system channeled away from the structure to an approved collector or outfall.

Mitigation Measure Geology-11, Vapor Barrier: A vapor retarder or barrier should be placed directly under the slab. A sand layer is not required over the vapor retarder from a geotechnical standpoint. During construction, all penetrations (e.g., pipes and conduits,) overlap seams, and punctures should be completely sealed using a waterproof tape or mastic applied in accordance with the vapor retarder manufacturer's specifications. The vapor retarder or barrier should extend to the perimeter cutoff beam or footing.

Resulting Level of Significance

These soil compaction parameters and recommendations have been reviewed and accepted by the California Geological Survey as appropriate for the Project, and the Project's design pursuant to these parameters has been reviewed and approved by the California Division of the State Architect. With construction of the Project as recommended, designed and approved, the hazards associated with expansive and/or collapsible soils will be reduced to levels considered acceptable by professional geotechnical engineers, and thus would mitigate this impact to less than significant.

Other Geologic Hazards - Naturally Occurring Asbestos

No sources of naturally occurring asbestos have been mapped near the site and therefore the potential for naturally occurring asbestos to impact the site is very low. The Project would have no impact related to naturally occurring asbestos.

Alternative Waste Water Disposal

The soils in relation to septic systems are not of concern for this Project because the Project would include connection to City sewer systems for wastewater disposal and would not include use of a septic system. ***No impact*** would occur.

Paleontological Resources

The Project site is in urbanized Oakland and is surrounded by urban development. Paleontological resources are not anticipated at or near the surface within the Project site due to historic development. However, construction-related subsurface disturbance of the Project site could expose and potentially damage previously unidentified paleontological resources.

Mitigation Measures

The following mitigation measures as listed in the Cultural Resources section of this Initial Study would serve to address the unlikely discovery of paleontological resources during construction:

Mitigation Measure Cultural-1: Survey of the Project Area (see details above)

Mitigation Measure Cultural-2: Inadvertent Discoveries (see details above)

Resulting Level of Significance

Pursuant to these mitigation measures, any excavations within 50 feet of a paleontological discovery would be temporarily halted or diverted until the discovery is examined by a qualified paleontologist, documented and evaluated for significance, and procedures established to consider avoidance of the resource or preparation of an excavation plan if avoidance is unfeasible. In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant. With required implementation of these mitigation measures, potential adverse effects on paleontological resources would be less than significant.

Greenhouse Gas Emissions

Would the Project:		Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a)	Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	❒	❒	■	❒
b)	Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	❒	❒	■	❒

Greenhouse Gas Emissions

Construction and operation of the Project would contribute additional sources of greenhouse gas (GHG) emissions, primarily through fuel consumption for transportation and energy uses on an ongoing basis. The Project is not anticipated to include stationary sources of GHGs that would generate emissions approaching the stationary source threshold of 10,000 $MTCO_2e$ per year. Any new stationary sources (e.g., emergency generator for the on-site elevator) will be subject to BAAQMD's requirement for New Source Review, and BAAQMD may impose conditions that would lead to GHG emission reductions from any new stationary sources that may be proposed.

The threshold of significance used in this Initial Study is based on BAAQMD CEQA Guidelines as recommended by the Air District for use by lead agencies. These thresholds consider a project to exceed the GHG threshold of significance if the project's emissions exceed 1,100 metric tons of carbon dioxide equivalent ($MTCO_2e$) per year, and/or exceed the efficiency threshold of 4.6 $MTCO_2e$ per service population per year.[20]

The CalEEMod emissions calculator was used to estimate the GHG emissions of the Project (see **Table 4**). Model inputs shown in this Table rely on conservative default assumptions built into the emission calculator, and do not rely on the additional mitigation measures that are included in the Project's design. The results of these default inputs for the Project are shown in the CalEEMod calculations for the Project (see Appendix A), and summarized below.

[20] BAAQMD, May 2017. The Air District is currently updating its existing thresholds of significance. The Draft Thresholds of Significance Justification Report: CEQA Thresholds for Evaluating Climate Impacts from Land-Use Projects and Plans was available for review during a 30-day public comment period from February 16 to March 18, 2022. The updated CEQA Guidelines will be publicly available once the Thresholds of Significance for Climate Impacts are adopted by the Air District Board of Directors, per: https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines

Table 4: Greenhouse Gas Emissions	
Emission Sources	**$MTCO_2e/yr$**
Construction (annualized over 40 years)	15.1
Area Sources	0.01
Energy	138.1
Mobile	649.5
Waste	31.5
Water	14.5
Total Annual GHG Emissions:	**848.1**
CEQA Threshold (Annual GHG Emissions)	1,100
Exceed Threshold?	**No**

Source: Lamphier-Gregory 2022, summary of CalEEMod results, included in Attachment X

Based on these calculated emissions, the Project would not exceed the Air District's recommended GHG emission threshold of 1,100 MTCO2e/year, and the Project impact would be less than significant.

Conflict with Adopted GHG Reduction Strategies

In July of 2020, the Oakland City Council adopted the City of Oakland's *2030 Equitable Climate Action Plan* (ECAP), with the intention that additional policies and ordinances would be adopted to implement some of the 2030 ECAP strategies. The 2030 ECAP sets forth a detailed, equitable path toward cost-effectively reducing Oakland's local GHG emissions by a minimum of 56% below baseline 2005 GHG emission levels by 2030. It provides for a transition away from fossil fuel dependence, removing carbon from the atmosphere through local projects, and ensuring that all of Oakland's communities are resilient to the foreseeable impacts of climate change by 2030. The current statewide goal pursuant to SB 32 is to reduce California's GHG emissions to 40 percent below 1990 levels by 2030. Oakland's adopted 2030 reductions target of 56% below Oakland's 2005 GHG emissions, reaching beyond that of the State's 40% target. The 2030 ECAP contains not only deeper targets, but also qualitatively different and more focused actions than those contained in its previous 2020 Energy and Climate Action Plan, including a major focus on building de-carbonization and energy resilience, fully removing natural gas from the built environment, and installing energy storage systems where appropriate and feasible. [21]

The City's 2030 ECAP does not have a specific numeric threshold for GHG emissions from individual projects. Instead, in December 2020, the City Planning Commission adopted an ECAP Checklist to show consistency with the 2030 ECAP. The ECAP Consistency Checklist includes topics such as consistency with the General Plan, parking limitations to reduce vehicle trip generation, electric vehicle charging infrastructure requirements, and all electric buildings (i.e., no natural gas connections). If a project can qualitatively demonstrate compliance with the ECAP Consistency Checklist items, or alternatively demonstrate to the City's satisfaction that a Checklist item is not applicable, then the project will be considered in compliance with the City's 2020 CEQA GHG threshold of significance

[21] City of Oakland, *2030 Equitable Climate Action Plan*, July 2020

Consistency with the 2030 Equitable Climate Action Plan Checklist

Although the Project is not subject to the City of Oakland's construction-related permits (the Project's design and building permit process is conducted through the California Division of the State Architect), the Project is generally consistent with the City's ECAP Checklist criteria, as summarized below:

- The Project is substantially consistent with the City's overall goals for land use and urban form. The Project involves removal of a prior underutilized school facility to accommodate District-related administrative uses and educational space, which are land uses conditionally permitted within the applicable zoning district of the Project site. The Project's height, setbacks and building mass are consistent with underlying zoning criteria.
- The Project site is located within a "Transit Accessible Areas" as defined in the City of Oakland Planning Code. The Project is located less than one-half mile walk from the Bay Area Rapid Transit District's (BART) West Oakland station, and AC Transit bus lines that run along Adeline Street, 10th Street and 14th Street are within 1 to 2 blocks of the site (CA-CHPS criteria SS 7.1). The Project does not provide any more parking spaces than necessary to accommodate anticipated parking demands.
- The Project does not include any structured parking, and so it is not designed to adapt such structured parking for future adaptation to other uses.
- The Project is subject to a Transportation Demand Management Program, which does include provision of transit passes for employees and students.
- The Project's parking area does include EV-ready conditions for future Plug-In Electric Vehicle (PEV) charging Infrastructure (CA-CHPS criteria EE 8.1).
- The Project would not result in displacement of any residents or essential businesses.
- The Project does include improvements to surrounding sidewalks and curb spaces, and does not introduce any conflicts with the City's adopted Bike and Pedestrian Plans. The Project will provide new walkways and bikeways from the building entry to the end of the property (CA-CHPS criteria SS 9.1).
- The Project does not create any new natural gas connections or hook-ups. The Project will not use natural gas consumption for space heating or water heating (CA-CHPS criteria EE 7.1)
- Whereas the Project is not required to comply with the City of Oakland Green Building Ordinance, the Project does comply with all CalGreen requirements (CA-CHPS criteria EE 8.1)
- The Project would reduce demolition waste from construction by 75% (CA-CHPS criteria MW 2.1), would provide for storage and collection of recyclables (CA-CHPS criteria MW 1.0), and construction materials would include at least 20% recycled materials by costs (CA-CHPS criteria MW 3.1)
- The Project is not located in a Very High Fire hazard Severity Zone.
- The Project would add a greater number of trees than will be removed.
- The Project will comply with all applicable NPDES C.3 requirements for protection of water quality (CA-CHPS criteria SS 5.1)

Based on the Project's general consistency with the City's ECAP Checklist criteria, as well as its CA-CHPS Scorecard that demonstrates the Project meets the criteria for CHPS-verified certification, the Project complies with applicable plans, policies and regulations adopted for reducing the emissions of greenhouse gases, and this impact would be less than significant.

Hazards and Hazardous Materials

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	❒	■	❒	❒
b) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?, or c) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	❒	❒	■	❒
d) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	❒	❒	■	❒
e) For a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	❒	❒	❒	■
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	❒	❒	❒	■
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	❒	❒	❒	■

Hazardous Material Site - per Cortese List

In California, regulatory databases listing hazardous materials sites provided by numerous federal, state and local agencies are consolidated in the "Cortese List" pursuant to Government Code Section 65962.5. The Cortese List is located on the California Environmental Protection Agency's (Cal EPA) website and is a compilation of the following lists:

- Hazardous Waste and Substances sites from Department of Toxic Substances Control (DTSC) EnviroStor database
- Leaking Underground Storage Tank Sites from the State Water Board's GeoTracker database
- Solid waste disposal sites identified by Water Board with waste constituents above hazardous waste levels outside the waste management unit
- "Active" Cease and Desist Order and Cleanup and Abatement Order (CAO) sites from the SWRCB, and
- Hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code, as identified by DTSC and listed on the EnviroStor database

The databases cited above identify sites with suspected and confirmed releases of hazardous materials to the sub-surface soil and/or groundwater. The reporting and status of these sites change as identification, monitoring and cleanup of hazardous sites progress. Typically, sites are "closed" once it has been demonstrated that existing site uses, combined with the levels of identified contamination, present no significant risk to human health or the environment.

The Project site is currently listed on the California Department of Toxic Substances Control (DTSC) EnviroStor database, as a School Site Remediation (see discussion, below).

2019 Phase I Environmental Site Assessment

A Phase I Environmental Site Assessment (Phase 1 ESA) of the Project site at 1011 Union Street was performed by Ninyo & Moore in December 2019 (see **Appendix F**). The Phase I ESA was performed in general accordance with ASTM International guidelines for Phase I ESAs (ASTM E 1527-05). The objective of this Phase I ESA was to identify records of environmental concern (RECs), defined as "the presence or likely presence of any hazardous substances or petroleum products in, on or at a property that posed a material threat of a future release to the environment". As part of that Phase I ESA, Ninyo & Moore obtained an Environmental Data Resources, Inc. (EDR) report, dated November 15, 2019, which contained a listing of all regulatory database sites located within a 1-mile radius of the Project site. Based on this information, the Project site was not identified at the time as being listed on the "Cortese List" pursuant to Government Code Section 65962.5.

The Phase I ESA did identify three on-site RECs with the potential to have adversely impacted the site. The identified RECs, included:

- potential use of lead-based paint on current or former residential structures constructed before January 1, 1979, and on school structures constructed before January 1, 1993
- potential application of termiticides containing organochlorine pesticides (OCPs) in soils in the area of current or former structures constructed prior to January 1, 1989
- potential for residual soil contamination to be present at the site related to an August 1998 removal of a 2,000-gallon heating oil tank, and on-site storage of hazardous substances, including diesel fuel storage for the on-site backup generator
- potential sources for metals and semi-volatile organic compounds (SVOCs) associated with a waste incinerator located in the basement of the Cole building

Based on these findings, the Phase I ESA recommended further investigations, including:

- Soil samples should be collected around the perimeter of the buildings and analyzed for lead, arsenic, and OCP
- Soil samples should be collected immediately adjacent to the incinerator and analyzed for metals and SVOCs

DTSC Oversight Agreement

In September of 2020, the District submitted the Phase I ESA to DTSC. In April of 2021, the District entered into an agreement with DTSC for oversight. DTSC has now entered the Project site into its EnviroStor website database, and is providing oversight of the process toward site clearance.[22]

[22] Identified as Central Administrative Center at Cole Campus (Case #60003015), Cleanup Status: Active as of 7/2/2020, Site Type: School – accessed at: https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60003015

Pursuant to this Agreement, the District submitted all background information, sample analysis results, environmental assessment reports, and other information pertinent to the hazardous materials management and/or release, characterization and cleanup of the site. DTSC held a scoping meeting with the District and its representatives, and provided recommendations for a subsequent Work Plan for a Preliminary Endangerment Assessment (PEA). In October 2021, the District submitted a Preliminary Environmental Assessment Workplan for approval by DTSC.

Preliminary Endangerment Assessment

Pursuant to approval of that Workplan, Ninyo & Moore prepared a Preliminary Endangerment Assessment (PEA) Report for the School District and the Department of Toxic Substances Control (DTSC) for the Project site (see **Appendix H**) in December of 2021. The PEA evaluated soil and soil gas for potential environmental concerns. As identified in the PEA Work Plan, constituents of potential concern (COPC) in soil and soil gas at the site include metals, TPHs, OCPs, PCBs, SVOCs, VOCs, PAHs and dioxins/furans. These COPCs may be from the current structures, former structures, fill materials, naturally occurring constituents, or former burned structures.

Pursuant to the PEA, soil samples were collected from 124 borings across the site, and soil-gas samples were collected from four dual-nested soil vapor probes installed at a depth of 5 and 10 feet bgs (see **Figure 15**). All samples were transported to a laboratory under proper chain-of-custody protocols for analysis.

The PEA screening evaluation for human health effects involved identifying chemicals of potential concern (COPCs), evaluating exposure pathways and media of concern, assessing chemical toxicity, and then characterizing risk. Estimated health risks are based on a calculated dose, which integrates exposure parameters for the receptors of concern with chemical- specific toxicity criteria. The calculated risks are then compared to health-based guidelines developed by the EPA and DTSC. For the purpose of the PEA screening evaluation, the potential dose is calculated for a resident (adult and child) occupying the site.

Exposure to COPCs can only occur if there is a complete pathway by which the COPCs in soil, water or air can be contacted by humans. Therefore, the evaluation of exposure pathways was the first step in the human health screening evaluation. Potential health hazards and risk are then calculated based on an evaluation of potential exposure concentrations and the toxicity of the COPCs. For purpose of the PEA, it was assumed that “hypothetical residents” at the site could be exposed to chemicals through incidental ingestion, dermal contact, inhalation of soil particulates containing COPCs, and inhalation of soil vapor containing COPCs. In accordance with PEA guidelines, exposures to COPCs were evaluated assuming hypothetical residential exposure.

The health risk evaluation was based on the application of conservative methods and assumptions in all phases of the assessment. Because potential exposure point concentrations were derived from maximum detected concentrations, conservative assumptions and methodologies were necessarily employed to minimize the possibility of underestimating risks. This practice, although commonly used in the risk assessment process, necessarily introduces a significant level of conservatism in the conclusions derived from the assessment. Based on the results of the PEA investigation, the following conclusions were derived:

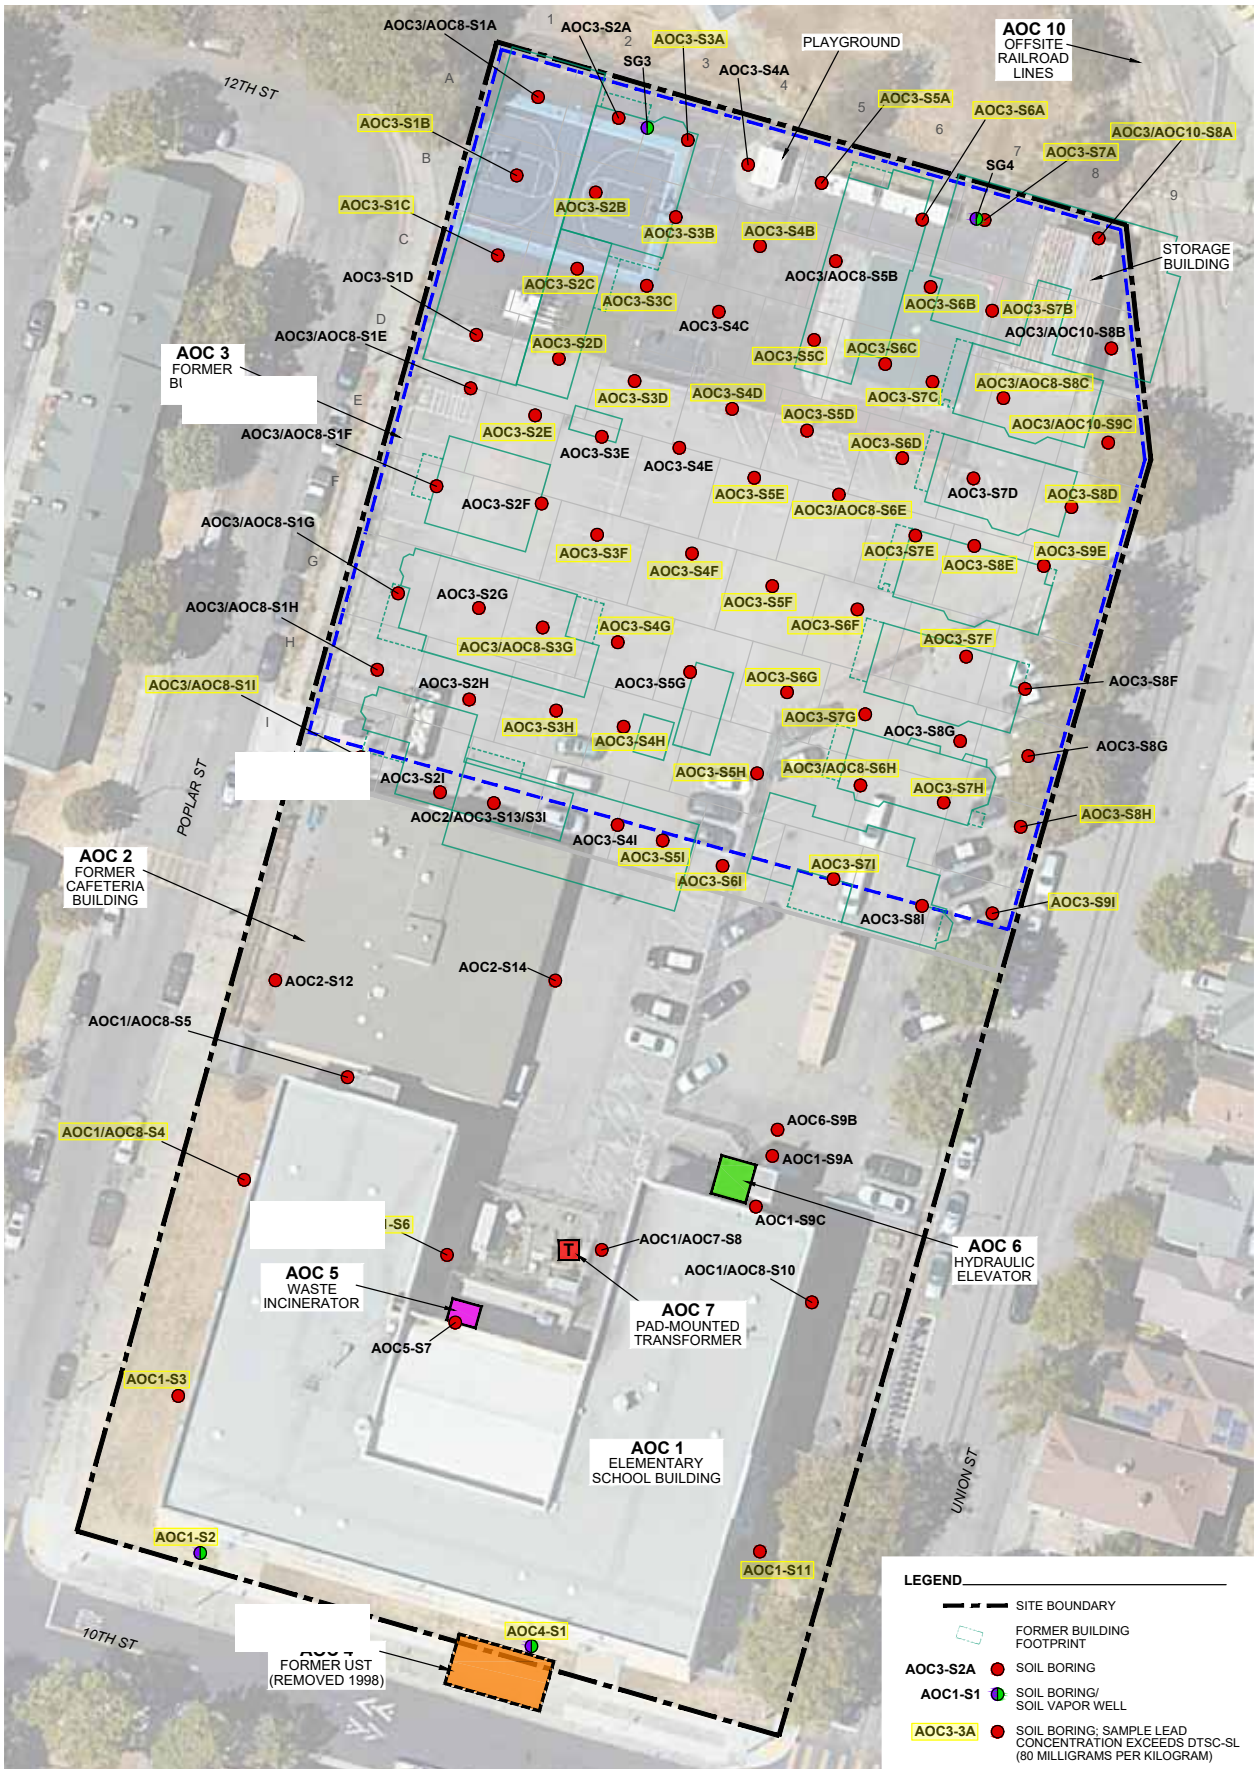

Figure 15
Soil Sample and Soil/Gas Sample Locations, Preliminary Endangerment Assessment

Source: Ninyo & Moore, December 2021

- The upper limit arsenic background concentration for at site was estimated to be 14.20 mg/kg, and 5 of the 124 soil samples collected at the site contained arsenic at concentrations higher than the estimated local background concentration. The distribution of arsenic contamination across the site appears to be limited and localized. The estimated 95% upper confidence limit (UCL) for arsenic using all available data was estimated to be 7.52 mg/kg.
- Relatively high concentrations of lead were detected in soil at the site. The estimated 95% UCL for lead was estimated to be 181.3 mg/kg. This value exceeds the DTSC soil screening value for lead of 80 mg/kg. Therefore, it is concluded lead in soil could pose a potential health hazard to future on-site receptors.
- Using maximum detected concentrations for all organic chemicals detected in soil at the site, the total incremental cancer risk for hypothetical residential exposure to site-related chemicals was estimated to be 4E-06. This value exceeds the acceptable cancer risk of 1E-06. The "risk drivers" were found to be dioxins/furans and Dieldrin.
- Using maximum VOC concentrations detected in soil gas, the total incremental cancer risk for hypothetical residential exposure to indoor air was estimated to be 5E-06. This value exceeds the acceptable cancer risk of 1E-06. The "risk driver" was found to be chloroform.[23]
- Using maximum detected soil chemical concentrations, the hazard indices estimated to result from soil exposure or indoor air exposure were estimated to be lower than 1. Both estimated hazard indices were within levels considered acceptable to California health and environmental protection agencies.

The PEA identifies that there are remaining data gaps that need further analysis. These data gaps include:

- Vertical delineation of lead concentrations that exceed screening levels, and
- Vertical and lateral delineation of dioxins/furans concentrations that exceed screening levels

Once these data gaps have been thoroughly investigated, the PEA recommends the following additional steps toward clearance of the site for future use pursuant to the Project:

- Evaluate mitigation and/or remediation options with respect to the proposed improvement plans (i.e., building locations, hardscape).
- Prepare a site-specific Health and Safety Plan and a Soil Management Plan for any work where contractors shall be working in or excavating soil.
- Delineate lead vertically in areas near the former buildings at the northern portion of the site, where grading is expected during development of the Project, and where soil will be removed and disposed of off-site. Vertical delineation will determine the distribution of elevated lead concentrations in soil that may be excavated during grading.
- Delineate dioxin/furans in soil vertically and laterally near the westerly side of the current Cole Middle School.

[23] It should be noted that chloroform is known to be formed from the reaction of chlorinated water with soil organic matter. Free chlorine can react with organic matter in soil to form chloroform and other trihalomethanes. Thus, it is highly likely that the chloroform detected in soil gas could have originated from chlorinated potable irrigation water in the subsurface. Furthermore, chloroform was only found above the SL in soil gas samples collected on along southern perimeter of the site in a landscaped area where irrigation lines were observed.

Preliminary Removal Action Work Plan (RAW)

In March of 2022, DTSC issued a Community Survey to help DTSC determine the level of community interest and potential desire for future community outreach activities related to cleanup of the Project site.[24] On April 1, 2022, DTSC and the District held a Scoping Meeting to discuss respective roles and responsibilities related to cleanup of the site, and to provide an overview of DTSC's Schools Unit process for remediation and cleanup. Based on this Scoping meeting, the following activities were identified as pending, pursuant to preparation, review and DTSC approval of a Removal Action Work Plan (RAW):

- A School Cleanup Agreement between the District and DTSC
- Submittal of a draft RAW(s) for DTSC review and approval [25]

As more fully described in the Project Description of this document, the preliminary approach for addressing areas of concern and chemicals of concern at the site is anticipated to involve remediation of soil contaminated with lead and arsenic during the construction phase of the Project. Soil excavation and removal with off-site disposal is expected to be the preferred remedial action alternative, to be fully developed as part of the RAW. Based on preliminary Scoping discussions, it is anticipated that the Project will involve two RAWs, separated into Phase 1 and Phase 2 areas to accommodate the Project's construction schedule.

- The Phase 1 RAW is expected to address an approximately 1.6-acre northerly portion of the site. The Phase I RAW is expected to involve excavation of this area to a depth of 3 feet to remove soils with lead and arsenic concentrations at levels that exceed DTSC environmental screening levels.
- The Phase 2 RAW is expected to address the remaining approximately 1-acre southerly portion of the area of the site, and is similarly expected to involve excavation of this area to a depth of 3 feet to remove soils with lead and arsenic concentrations at levels that exceed DTSC environmental screening levels. The Phase II RAW is also assumed to include further evaluation and identification of methods for addressing soil vapor near the westerly side of the current Cole Middle School building.

Each of these Removal Action Work Plans will identify the remediation goals and objectives, and the performance measures for soil excavation and off-site disposal of lead and arsenic-contaminated soil. They are also expected to include the following:

- a description of the Removal Action process, site background information, description of the nature, source and extent of contamination, risk evaluation and clean up goals, and an engineering evaluation/cost analysis
- a list of All Applicable or Relevant and Appropriate Requirements (ARARs), including chemical-specific ARARs in accordance with DTSC human health risk screening process (including Air Quality Management and a Health and Safety Plan), action-specific ARARs (for waste management, storm water discharge and quality assurance) and location-specific ARARs
- an implementation plan, which will include field documentation, site preparation and security measures, identification of work zones, the excavation plan, meteorological and air monitoring, a Sampling and Analysis Plan (waste characterization and excavation confirmation sampling), a

[24] DTSC, March 22, 2022, accessed at: https://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=60003015&enforcement_id=60517542

[25] DTSC, April 1, 2022, accessed at: https://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=60003015&enforcement_id=60517946

Transportation Plan for off-site disposal, backfill and site restoration plans, and a Project Schedule and Report of Completion.

Regulatory Requirements / Mitigation Measures

Pursuant to Health and Safety Code requirements for all responses actions for school sites (Education Code Section 17210.1, subsections (a) (1) and (2), and Section 17213.2, subsection (a)), the Project is required to complete the environmental review and cleanup process for the Project under the oversight of DTSCs Brownfields Restoration and School Evaluation Branch. Through this process, DTSC ensures protection of children, staff and the environment from the potential effects of exposure to hazardous materials.

Regulatory Requirement Hazards-1, Completion of the DTSC Environmental Review and Cleanup Process: Pursuant to Health and Safety Code requirements for projects under the regulatory review and oversight of DTCS's Brownfields Restoration and School Evaluation Branch, the Project must complete the DTSC-established protocols for site evaluation and cleanup. Pursuant to this process, remaining steps include, but are not limited to the following:

1. Approval and acceptance of a final Preliminary Environmental Assessment
2. Entering into a subsequent Voluntary Cleanup Agreement or School Cleanup Agreement
3. Preparation of a Removal Action Work Plan or Remedial Action Plan, including providing additional opportunities for public comment
4. Conducting all necessary cleanup activities pursuant to an approved Removal Action Work Plan or Remedial Action Plan
5. Obtaining a "No Further Action" letter from DTSC, once all cleanup activities are satisfactorily completed under DTSC oversight

Resulting Level of Significance

With full compliance with all DTSC-established procedures and protocols, threatened releases or potential releases of hazardous substances at or from the Project site will be fully investigated and remediated, such that the Project would not create a significant hazard to the public or the environment.

Hazardous Materials near Schools

The nearest schools to the Project site are Martin Luther King Jr. Elementary School (960 10th Street) and Ralph J. Bunche Academy (1240 18th Street), both of which are located approximately 0.3 mile from the Project site. There are no other schools located within one-quarter mile of the Project site. As noted above, hazardous materials used during construction and operation of the Project would be used in compliance with applicable regulations. Compliance with applicable regulations would reduce the potential hazardous materials exposure, and no impact to other nearby schools would occur.

Hazardous Materials Risks during Construction

As part of the Removal Action Work Plan for the site, contaminated soil may be temporarily stockpiled on-site for confirmation testing prior to being transported to an approved off-site disposal facility. There is a risk that such stockpiled soils could be subject to dispersal from wind and/or stormwater runoff.

The potential for off-site exposure to dust from contaminated soil resulting from disturbance of impacted soils during excavation activities is not considered a significant exposure pathway. This is because the exposure duration during transport is short, dust will disperse, and dust will be monitored at the perimeter of the site during excavation. Minor off-site exposure may occur during transport of

excavated contaminated soil to the disposal location. The level of exposure is not a significant impact given the very short-term exposure and the widespread dispersal of any dust released during transport.

Other construction and operation activities associated with the Project would involve the routine transport, use and disposal of hazardous materials including, but not limited to fuels, oils, solvents and glues. Inadvertent release of large quantities of these materials into the environment could adversely affect workers, the public, soil, or water quality.

Regulatory Requirements / Mitigation Measures

As more fully addressed in the Hydrology section of this Initial Study, the Project would be required to implement construction Best Management Practices during construction as part of a Stormwater Pollution Prevention Plan as required by the National Pollution Discharge Elimination System General Construction Permit. Implementation of these required BMP would minimize the potential for adverse effects to workers, the public, soils, and water quality, and this impact would be less than significant.

The District will be required to prepare separate Site-Specific Health and Safety Plans and a Soil Management Plans for DTSC approval prior to any work in Phase I and Phase II areas where contractors will be working in, or excavating soil.

Regulatory Requirement Hazards-2, Soil Management Plan: Pursuant to DTSC's review and approval of the Phase I and Phase II Removal Action Work Plans, these approvals will also require preparation and implementation of a Soil Management Plan (SMP). The SMP is to be implemented during future remediation excavation and construction activities to protect construction workers, site occupants and off-site receptors from potential exposure to lead and arsenic in the soil. The SMP will serve as the guidance document for evaluation of clean, contaminated and hazardous soils during soil disturbance activities. Sections of the SMP will include:

1. A program of participant roles and responsibilities, description of the physical setting, soil screening criteria, soil management objectives, remedial actions and notifications
2. Health and Safety plans, including a discussion of proper personal protective equipment (PPE) to mitigate direct contact exposure of contaminated soils to site workers
3. Delineation of exclusion work zones and hazard warning signage, best management practices (BMPs) for PPE and equipment decontamination, and site worker hygiene
4. Soil excavation and monitoring (including air monitoring of dust levels, and the requirement that all excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph (see Mitigation Measure Air-2)
5. Soil segregation, stockpiling soil and stockpile management, including proper storage of excavated soils to prevent cross contamination (e.g. stockpiling on plastic sheeting and covering), to prevent wind dispersal by requiring that stockpiled soil on-site be watered or treated with soil stabilizers, and covered (see Mitigation Measure Air-2), and to prevent inadvertent contamination from stormwater runoff (see Mitigation Measure Hydrology-2 pertaining to SWPPP requirements of the NPDES regulations)
6. Transport management, including the requirement that all trucks off-hauling soil maintain at least two feet of freeboard and employ covers (see Mitigation Measure Air-2)

With implementation of DTSC's regulatory requirements (including Project-specific mitigation measures) the activities associated with excavation and removal of contaminated soil would not create a significant impacts related to risks of exposure to contaminated materials during the soil removal process.

Routine Use and Risk of Spill of Hazardous Materials during Operations

Operation of the Project may include the handling, storage and transport of small amounts of hazardous materials that may include cleaning products; pesticides and fertilizers used for grounds maintenance; and paints, solvents, fuels and lubricants used in building operation and maintenance. The Project would not be expected to handle, store or transport these materials in large quantity. Most of these chemicals are typical household chemicals that must be used according to the manufacturers' recommendations and labeling, but do not create a significant hazard to the environment.

Regulatory Requirements

Title 8 of the California Code of Regulations requires every employer to develop and implement an effective Injury and Illness Prevention Program to improve safety and health in the workplace. Injury and Illness Prevention Program elements include hazard assessment, accident/exposure investigation, hazard correction, and training and instruction. OSHA has found that these programs are effective in reducing the number and severity of injuries and illness in the workplace, and is required of the Project.

Businesses that store hazardous materials or hazardous substances at reportable quantities are required to prepare and submit a Hazardous Materials Business Plan to the Alameda County Department of Environmental Health. The general reportable quantities are equal to or greater than 55 gallons of a liquid, 200 cubic feet of a gas, and 500 pounds of a solid. The Project is not anticipated to use or store any hazardous materials at reportable quantities.

By complying with manufacturers' recommendations and labeling, as well as applicable regulations as identified above, the Project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, and this impact would be less than significant.

Airport Hazards

The Project site lies approximately 6 miles to the northwest of the Oakland International Airport and is not within its Airport Influence Area. [26] There are no other airports, either public or private, within the vicinity of the project site. No impact related to airport hazards would occur.

Emergency Response Plan

The Project has been subject to the California Division of State Architect (DSA) review of all architectural, mechanical/electrical and fire/life safety plans. DSA approvals included review by the Oakland Fire Department's Fire Prevention Bureau. This review has included verification that the proposed site ingress and egress is adequate for on-site police protection, fire access and emergency response.

The Project would not alter traffic patterns and would not impair implementation of any adopted emergency response plan or emergency evacuation plan. The Project would therefore have no impact related to an emergency response plan.

Wildland Fire

The Project site is located in an urbanized area removed from areas typically subject to wildland fire, and it has not been identified as a very-high fire-hazard severity zone. [27] Therefore, the Project would have no impact related to wildland fire.

---

Hazardous Materials near the Project's Education Program (non-CEQA)

As identified in the Phase I ESA, the California Cereal Products/Nabisco Brands Inc. property on 14th Street, downgradient of and north of the Project site, had two 10,000-gallon petroleum fuel oil USTs and one 750-gallon diesel UST removed in 1993. In 1994 and at this same site, a number of containers of unknown substances were dumped and burned on the railroad tracks. This spill occurred approximately 300 feet north of the Project site, and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean-up was completed, and that the dumping took place downgradient from the site, this is was not considered a records of environmental concern (REC) to the Project site. Several other off-site facilities were located within the EDR search radius from the Project site, and were evaluated as to their potential to impact soil, soil vapor, and/or groundwater at the Project site. The Phase I ESA found a low likelihood that these off-site properties represented a REC to the site, based on one or more of the following factors:

- The nature of the database(s) on which the property is listed, and/or because the property was not listed on a database that reports unauthorized releases of hazardous substances
- Reported regulatory agency status (i.e., case closed)
- Reported nature of the case (i.e., soil contamination only)
- Reported distance of the property from the site, and/or
- Location of the property in relation to the site with respect to topography or expected groundwater flow direction (northeast)

Further assessment of potential impacts from off-site properties to the north and south of the Project site included soil and soil gas samples collected along the northern and southern boundaries. Soil samples were analyzed for TPHd, TPHmo, TPHg, VOCs, and CAM 17 Metals. Soil gas samples were analyzed for VOCs, fixed gases (oxygen, carbon dioxide and methane) and helium (tracer gas compound). No exceedances of environmental screening levels were detected in any of the soil samples, and the only exceedance was a soil gas sample for chloroform. Further assessment of potential impacts from the railroad tracks adjacent to the northeast corner of the site included soil samples collected from adjacent soil borings. Soil samples were analyzed for CAM 17 metals, SVOCs, and PAHs. Only exceedances of lead were detected, and SVOCs and PAHs were not detected above the laboratory reporting limits.

Pending any further analysis that may be required (see Regulatory Requirements, above), there are no other known off-site contaminated sites or sources that would emit hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste within one-quarter mile of the Project. This impact is considered less than significant.

Hydrology and Water Quality

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	❒	❒	❒	■
b) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?				
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would:				
i) result in substantial erosion or siltation on- or off-site;	❒	■	❒	❒
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	❒	❒	■	❒
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	❒	■	❒	❒
d) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	❒	❒	■	❒
e) In flood hazard, tsunami or seiche zones, risk release of pollutants due to project inundation? Impede or redirect flood flows?	❒	❒	❒	■

Discharge in Violation or Conflict with a Water Quality Control Plan

Operation of the Project would not include any types of operations or land uses that would directly result in substantial degradation of water quality, or that would violate any water quality standards or waste discharge requirements.

Water Quality and Erosion during Construction

Site preparation and grading, and soil removal activities as may be identified in the DTSC-approved Remedial Action Workplan (as identified in the Hazards section of this Initial Study), all have the potential to expose underlying soils to wind and water erosion, and to introduce pollutants into stormwater runoff. Eroded soils can be carried by stormwater runoff into the downstream drainage channels and eventually into the Bay, causing increased sedimentation. Construction activities associated with the Project could adversely affect water quality through the potential discharge of construction materials and wastes to the stormwater collection system. The delivery, handling and storage of construction materials and wastes, as well as use of construction equipment, could also introduce the risk of stormwater contamination. Polluted stormwater or excessive sedimentation can lead to degradation of downstream waters.

Regulatory Requirements / Mitigation Measures

The Project is required to comply with regulatory requirements of the State Water Resources Control Board (SWRCB), including implementing all necessary measures to prevent excessive sedimentation in stormwater runoff or carrying of pollutants off-site in stormwater runoff during construction. Pursuant to existing regulatory requirements, the following measures are required of the Project:

Regulatory Requirement Hydrology-1, State Construction General Permit and SWPPP: The Project applicant shall file a Notice of Intent with the State Water Resources Control Board (SWRCB) for construction-period releases of stormwater to be covered under the State's Construction General Permit. Pursuant to the requirements of that at Permit, the Project sponsor shall prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) and other permit documents as may be required by the SWRCB. At a minimum, the SWPPP shall include:

1. Best Management Practices (BMPs) to minimize erosion and sediment (i.e. gravel bags, silt fence, straw wattle, sediment basin, soil stabilizers, etc.)
2. BMPs to minimize non-stormwater discharges (i.e. concrete waste management, material waste management, good housekeeping practices, etc.)
3. Site inspections and BMP maintenance

Resulting Level of Significance

By obtaining a Construction General Permit from the SWRCB and implementing all applicable provisions of that permit (i.e., a Project-specific SWPPP), the Project will prevent stormwater contamination, and control sediment and erosion to levels as required of that permit, and construction-period impacts on water quality will be reduced to less than significant.

Storm Drainage Conveyance

Under current conditions, only about 6,675 square feet (or about 6%) of the site is covered by pervious surface (the landscape strips surrounding three sides of the existing Cole Building), and the remaining approximately 104,345 square feet (or 94%) of the site is covered by impervious surfaces (i.e., the Cole Building, the Cafeteria building, the modular shed and asphalt). Under Project conditions, 23,373 square feet (or about 21%) of the site will be covered by pervious surfaces (landscaping and biotreatment areas), and the remaining approximately 87,647 square feet (or 79%) of the site will be covered by impervious surfaces (i.e., the new Cole Administration/Education Building, surface parking and sidewalks) (see **Appendix I**)

Since the Project will be decreasing total impervious surface area on the site, the rate and amount of surface runoff will not be substantially increased in a manner that might otherwise result in flooding on- or off-site. The impact of the Project pertaining to increased stormwater runoff will be less than significant.

Post-Construction Water Quality

The Project will introduce new sources of non-point water pollutants such as automotive fluids, pesticides, fertilizers and herbicides used in landscaped areas, trash and excess irrigation water, and air pollutants deposited on roof tops and other impervious surfaces. These non-point sources of pollutants could enter the storm drainage system and eventually contribute to surface water-quality degradation.

Regulatory Requirements

The Project's stormwater runoff would connect to, and ultimately be discharged through the City's stormdrain system. Therefore, the Project would be subject to the City's waste discharge requirements

under to the National Pollutant Discharge Elimination System (NPDES) permit. These requirements regulate the discharge of stormwater runoff from municipal separate storm sewer systems (MS4s) of Alameda County (including Oakland), and which are individually permitted under a San Francisco Bay Municipal Regional Stormwater Permit (MRP - Order R2-2009-0074; NPDES Permit No. CAS612008). The MRP ensures attainment of applicable water quality objectives and protection of the beneficial uses of receiving waters and associated habitat by requiring municipal dischargers (e.g., Oakland) to not cause exceedances of water quality objectives nor cause certain conditions to occur that create a condition of nuisance or water quality impairment in receiving waters.

Provision C.3 of the MRP requires new project and redevelopment projects that create or replace 10,000 square feet or more of impervious surface to implement certain measures to protect water quality and prevent erosion. The Project would exceed the 10,000 square-foot criteria, and would be subject to regulations that seek to minimizing sediment and other pollutants in site runoff. The goal of Provision C.3 of the MRP is to include appropriate source control, site design and stormwater treatment measures in new development projects to address both soluble and insoluble stormwater runoff pollutant discharges, and prevent increases in runoff flows. The Project will therefore be subject to the following regulatory requirement:

Regulatory Requirement Hydrology-2, Post-Construction Stormwater Management Plan: The Project shall be subject to compliance with the requirements of Provision c.3 of the Municipal Regional Stormwater Permit, including developing and implementing a Post-Construction Stormwater Management Plan (SWMP) subject to the review and approval of the City of Oakland (as the discharge permittee). The SWMP must identify the location and size of new and replaced impervious surfaces, the directional surface flow of stormwater runoff, and the location of proposed on-site storm drain lines, the site design measures to reduce the amount of impervious surface area, source control measures to limit stormwater pollution, and stormwater treatment measures to remove pollutants from stormwater runoff.

Project's Proposed Preliminary Stormwater Management Plan

The Project sponsor has prepared a preliminary post-construction Stormwater Control Plan to demonstrate how the requirements of the c.3 provisions of the MRP will be implemented at the Project site (see **Appendix I**).[28] This preliminary post-construction Stormwater Control Plan demonstrates that the Project site will be divided into five separate Drainage Management Areas (DMAs), and that each of these DMAs will be provided with water quality treatment in separate bio-retention planter areas that are sized to meet the treatment requirement from each DMA. The Project's stormwater drainage system will route all stormwater runoff from the Project's hardscape areas (i.e., rooftops, parking areas, sidewalks and walkways) into these bioretention planters which will serve both as stormwater detention and water quality treatment prior to discharge to the City of Oakland's storm drain system (see **Figure 16**). The bioretention areas have been sized to meet the volume of storm flows routed through each treatment area, as indicated in **Table 5,** below.

Table 5: Post-Construction Stormwater Bioretention Volume				
Drainage Mgt. Area	**Pervious Surface Area (sf)**	**Impervious Surface Area (sf)**	**Required Treatment Volume (cf) [1]**	**Provided Treatment Volume (cf)**
DMA 1	1,431	583	Pervious surfaces exceed 2:1 ratio as self-treating	
DMA 2	5,820	23,650	1,401	1,439
DMA 3	3,590	17,773	1,048	1,054
DMA 4	3,457	14,847	878	880
DMA 5	9,075	30,793	1,833	1,846
Total:	**23,373 (21%)**	**87,646 (79%)**	**5,160**	**5,218**

Source: Siegfried, February 2022 (see **Appendix I**)

Notes: 1. Required capture volume per Alameda County C.3 Technical Guidance V4.0 worksheet for Calculation the Water Quality Design Volume

With implementation of a post-construction Stormwater Management Plan, the Project will provide adequate BMPs for the treatment of water quality in stormwater runoff from the Project site, and these BMPs will be installed, implemented and maintained in a manner that will reduce post-construction water quality impacts to acceptable, less than significant levels. The Project would be consistent with policies and regulations related to stormwater pollutants, reducing the potential for impacts on water quality to less than significant.

Groundwater

The Project is not expected to involve substantial excavation that would affect groundwater. Dewatering activities are not anticipated to be necessary, but if subsequently determined to be required, any dewatering activities associated with the Project must comply with the General Construction Permit and requirements established by the RWQCB to ensure that such activities would not result in substantial changes in groundwater flow or quality.

The Project would not increase impervious surface area of the site (the site is currently nearly fully paved, other than side yard landscape), and new landscaping and stormwater capture would allow the minimal groundwater recharge that is occurring to continue. The Project would use potable water from the public water system for onsite water needs, and would not rely on groundwater for potable supply. The project would not increase groundwater use, deplete groundwater supplies, or interfere with groundwater recharge. No impacts on groundwater resources are anticipated.

Flood Risk

The Project site is not located within a 100-year flood zone (see **Figure 17**),[29] and it is not within a tsunami inundation zone.[30] Further, the site is not located near an inland body of water. The Project site is not at risk for inundation from flood hazard, tsunamic or seiche, would not pose a risk of release of pollutants due to project inundation, and would not impede or redirect flood flows. No impacts related to flooding conditions would occur.

Land Use and Planning

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Physically divide an established community?	❒	❒	■	❒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	❒	❒	■	❒

Division of a Community

Division of an established community typically occurs when a new physical feature physically transects an area, thereby removing mobility and access within an established community. The division of an established community can also occur through the removal of an existing road or pathway, which would reduce or remove access between a community and outlying areas. There is no aspect of the Project that would substantially reduce mobility or access.

There is a wide mix of land use types in the immediate vicinity of the Project site. These include Wade Johnson Park to the immediate north, the Oakland Housing Authority's West District offices to the immediate south, single-family residential homes to the east, and attached low-rise apartments of the Peralta Villa public housing community (owned and operated by the Oakland Housing Authority) to the west. The existing Cole Middle School Building, the Cafeteria building and existing parking currently occupies an entire city block within the middle of these existing land uses, and the Project would occupy generally this same space but with a different building and parking configuration. Nothing about the Project would physically divide the surrounding community any more than it is already divided, and the Project provides a relatively low impact use that separates the surrounding residential neighborhood from those industrial and light-industrial land uses that line 14th Street from Mandela Parkway to Union Street (a block to the north). Therefore, the Project would not divide an established community, and the Project would have a less than significant impact.

Conflict with Plans or Policies Adopted to Mitigate an Environmental Effect

There is no Habitat Conservation Plan, Natural Community Conservation Plan, or other adopted habitat conservation plan applicable to the Project site. The Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

As is noted in the City of Oakland's West Oakland Specific Plan EIR, there are many locations within West Oakland that are near freeways and other sources of diesel exhaust particulates and other toxic air contaminants (TACs). These sources of TAC pose a significant risk to human health. There are portions of West Oakland that are near freeways, high volume roadways, BART and the railroads that are also exposed to noise levels that may exceed City and state standards for noise compatibility. There are numerous properties throughout West Oakland with known contamination from prior industrial uses or

other sources. The City, in collaboration with other public agencies (BAAQMD, DTSC, etc.) has developed policies and regulations for the purpose of avoiding or mitigating these existing conditions. [31]

However, as is documented elsewhere in this Initial Study, the Project site is not located in sources of diesel exhaust particulates or other toxic air contaminants, is not near sources of noise levels that exceed City or state standards for noise compatibility, and is not a known previously contaminated site. Those City policies and regulation adopted for the purpose of avoiding or mitigating such conditions do not apply to the Project site.

The Project would not result in a substantial increase in land use intensity at the site, and would not introduce a new use that would conflict with other land uses in the vicinity. The Project would not conflict with any land use plan, policy, or regulation adopted to avoid or mitigate an environmental effect, and the Project's effects would be less than significant.

[31] City of Oakland, West Oakland Specific Plan Draft EIR, January 2014, accessed at https://www.oaklandca.gov/resources/current-environmental-review-ceqa-eir-documents-2011-2021

Mineral Resources

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	❒	❒	❒	■
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	❒	❒	❒	■

Minerals

Areas designated as an Aggregate Resource sector are judged to be of prime importance in meeting future mineral needs in the region, and land use decisions must consider the importance of these resources to the region as a whole. According to the California Department of Conservation Division of Mines and Geology, the Project site is not currently considered an Aggregate Resource sector.[32]

The Leona Quarry (which was more than 5 miles from the Project site) was the last mine in Oakland to be identified as a regionally significant source of aggregate resources. The Leona Quarry has been closed for many years, and there is no other land in Oakland with such a designation. The Project site contains no known mineral resource that would be of value to the region, and is not a locally important mineral resource recovery site. No impact would occur.

[32] California Department of Mines and Geology, accesses at: ftp://ftp.consrv.ca.gov/pub/dmg/pubs/ofr/OFR_96-03/ , Plate 12

Noise

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	❒	■	❒	❒
b) Generation of a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	❒	❒	■	❒
c) Generation of excessive groundborne vibration or groundborne noise levels?	❒	❒	■	❒
d) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	❒	❒	❒	■

Information for this section of the Initial Study has been derived from the following primary source:

- Illingworth & Rodkin , OUSD Central Administrative Center at Cole Campus Project Noise Study, April 7, 2022 (**Appendix J**)

Existing/Ambient Noise Conditions

The surrounding area is predominantly residential with multi-family residences to the west and south, an Oakland Housing Authority office to the south, and single-family residences to the east and northeast. The California Cereal Products industrial site to the north serves as the primary source of noise in the vicinity.

A noise monitoring survey was performed between July 15, 2020 and July 17, 2020 to quantify and characterize ambient noise levels at the site and in the vicinity. The monitoring survey included one long-term measurement and one short-term measurement.

- Long-term measurement was made at the southwest corner of the site near the intersection of Poplar Street and 10th Street. This location was chosen in order to characterize noise resulting from local traffic and industrial sources in the general vicinity, including ambient noise at the existing residences to the west. Hourly average noise levels at this location ranged from 54 to 65 dBA Leq during the day, and from 50 to 56 dBA Leq at night. The day-night average noise level on July 16, 2020 was 62 dBA Ldn.
- Short-term noise measurement was made over a 10-minute period on Wednesday, July 15, 2020 between 8:30 a.m. and 8:40 a.m. This measurement quantified noise levels near the northwestern corner of the site, across from Wade Johnson Park and approximately 275 feet southwest of the California Cereal Products industrial site (see **Table 6**). As with the rest of the site vicinity, noise at this location was dominated by industrial activities.

Table 6: Summary of Short-Term Noise Measurement Data (dBA)

Noise Measurement Location	Lmax	L(1)	L(10)	L(50)	L(90)	Leq(10-min)	Ldn1
ST-1: Across Poplar Street Near Northwest Corner of Site, ~175 feet Southwest of California Cereal Products Site	67	67	67	66	65	66	71

Source: Illingworth & Rodkin, April 2022

The noise environment at the Project site and vicinity is primarily the result of industrial operations at the California Cereal Products site located approximately 150 feet north of the nearest property line to the Project. Other secondary sources of noise, such as traffic along local roadways and distant highways, are insubstantial and dominated by noise from operations at this industrial site.

Temporary Construction Noise

Construction activities for the Project are to be carried out in stages. During each stage of construction, there would be a different mix of operating equipment, and noise levels would vary by stage, and vary within stages based on the amount of equipment in operation and the location at which the equipment is operating. Project construction is expected to last approximately 15 months, which includes two full construction phases:

- Phase I involves demolition of the Cafeteria Building foundation and surrounding asphalt and concrete; remediation, excavation and fill of the northerly two-thirds of the site, pouring of footings and the foundation for the new building; construction of the new building; and exterior/interior finishes.
- After Phase I is complete, Phase II would involve a similar phasing sequence of demolition of the existing Cole Middle School; remediation, excavation and fill of the remaining southerly one-third of the site, site grading and prep for paving; paving of the new parking lot; and exterior finishes and landscape.

Construction is expected to take place Mondays through Fridays, during the hours of 7:00 a.m. to 7:00 p.m. (consistent with the provisions of the City of Oakland Planning Code). Specific information on numbers and types of construction equipment to be used per phase is not available, but pile driving is not proposed as a method of construction. Typical construction noise levels for the different phases of construction (at a distance of 50 feet) are shown in **Table 7**. Using these typical noise levels for the construction of office buildings, noise from the Project's construction may reach between 75 to 89 dBA Leq at a distance of 50 feet. During the most intense soil export and import construction phases, loaders, backhoes and haul trucks will all be in full operation for periods of between one and three weeks at a time, and construction noise during these periods could exceed 89 dBA at 50 feet.

Table 7: Typical Ranges of Construction Noise for a Low-Rise Office Building (dBA Leq at 50 Feet)

	Maximum	Minimum
Ground Clearing	84	84
Remediation/Excavation	89	79
Foundations	78	78
Building Erection	87	75
Finishing	89	75

Maximum = All pertinent equipment present at site.

Minimum = Minimum required equipment present at site.

Source: US EPA, Legal Compilation on Noise, Vol. 1, p. 2-104, 1973

Residential property lines nearest the site are located about 170 feet east and west of the approximate center of construction. At this distance, construction noise levels may reach 64 to 78 dBA Leq during busy periods of construction, when multiple pieces of equipment are in operation. This would result in an increase of between 6 to 20 dBA over the existing daytime ambient noise level of 58 to 69 dBA Leq at these residences. During the most intense soil export and import construction phases, haul trucks will be operating along the public streets (as near as 50 feet form adjacent residences) and construction noise during these periods could exceed 89 dBA.

The nearest non-residential property lines are located at the Wade Johnson Playground about 250 feet north of the approximate center of construction, and at the Oakland Housing Authority office building about 300 feet south of the approximate center of construction. Noise levels during busy periods of construction with multiple pieces of equipment in operation may reach 61 to 75 dBA Leq at the Wade Johnson Playground, and 59 to 73 dBA Leq at the Oakland Housing Authority office building. This would result in an increase of up to 10 dBA over the existing daytime ambient noise level of 64 to 75 dBA Leq at Wade Johnson Park, and an increase of 6 to 20 dBA Leq over the existing daytime ambient noise level of 53 to 64 at the Oakland Housing Authority office building.

Mitigation Measures

The following mitigation measures are recommended to reduce construction noise, to limit construction hours, and to minimize disruption and annoyance during the construction process:

Mitigation Measure Noise-1, Construction Days/Hours: The Project's construction schedule should comply with the following restrictions concerning construction days and hours:

1. Construction activities should be limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday, except that extreme noise generating activities greater than 90 dBA and soil import and export operations shall be limited to between 8:00 a.m. and 4:00 p.m. Use of concrete saws shall be limited to the hours between 8:00 am and 4:00 pm on weekdays.
2. Construction activities should be limited to between 9:00 a.m. and 5:00 p.m. on Saturday, but only within the interior of the building with the doors and windows closed.
3. No construction is allowed on Sunday or federal holidays.
4. Any construction activity proposed outside of the above days and hours for special activities (potentially such as the longer-duration soil export and import operations) shall be evaluated on a case-by-case basis by the District, with criteria including the urgency/emergency nature of the work, the proximity of residential or other sensitive uses, and a consideration of nearby

residents'/occupants' preferences. The District shall notify property owners and occupants located within 300 feet at least 14 calendar days prior to construction activity proposed outside of the above days/hours.

Mitigation Measure Noise-2, Construction Noise Control Best Management Practices (BMPs): The District and the District's contractor should implement best management practices (BMPs) for noise reduction to reduce construction noise to the extent practical. Noise reduction BMPs include, but are not limited to the following

1. Equipment and trucks used for construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds), wherever feasible.
2. Impact tools (e.g., jackhammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used. These types of mufflers can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used if such jackets are commercially available, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures.
3. Use electrical power instead of generators, where feasible.
4. Locate stationary noise sources as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers or use other measures to provide equivalent noise reduction. Stage large equipment, compressors or generators at least 25 feet from the site perimeters when work is not being done near these uses.
5. The noisiest phases of construction should be limited to less than 10 days at a time. Exceptions may be allowed if the District determines an extension is necessary and all available noise reduction controls are implemented.
6. Construction activities should be conducted in a manner that minimizes the noise impact at the adjacent property boundaries wherever possible. Construction equipment shall be positioned as far from noise sensitive receptors as possible.
7. Prohibit unnecessary idling of internal combustion engines.
8. Erect temporary plywood noise barriers around the construction site during the loudest construction phases (ground clearing and excavation).

Mitigation Measure Noise-3, Noise Monitoring and Complaint Response: The District should establish and implement a set of procedures for responding to complaints received pertaining to construction noise, and implement these procedures during construction. These procedures should include:

1. Notify property owners and occupants located within 300 feet of construction activities at least 14 calendar days prior to commencement of construction.
2. Designate an on-site construction complaint and enforcement manager for the project.
3. Post a large on-site sign near the public right-of-way containing permitted construction days/hours, complaint procedures and phone numbers for the complaint manager.
4. Construction noise monitoring should be undertaken if reliable noise complaints are received during demolition, excavation and/or construction activities.

Resulting Level of Significance

Implementation of the above mitigation measures would reduce construction noise levels emanating from the site, limit construction hours, and minimize disruption and annoyance. The use of noise control BMPs is anticipated to reduce construction noise levels by 5 to 10 dBA. With implementation of these controls and recognizing that noise generated by construction activities would occur over a temporary period, the temporary increase in ambient noise levels would be less than significant.

Based on applicable City of Oakland standards, construction noise impacts are considered significant if construction activities exceed the noise performance standards of the City Noise Ordinance for more than 10 days. These standards are 70 dBA at commercial land uses and 65 dBA at residential uses, during weekday daytime hours. The City of Oakland Noise Ordinance allows for an exemption from these standards if an acoustical analysis is performed that identifies measures to reduce potential impacts. Since an acoustic analysis has been performed for the Project and mitigation measures have been identified, an exception from these standards is warranted.

Permanent Noise from On-Site Operations

Operational noise sources proposed with the Project include mechanical equipment, parking, and testing of an emergency backup generator.

Mechanical Equipment

Heating, ventilation and air conditioning (HVAC) equipment for the Project would include a variable refrigerant flow (VRF) system of outdoor heat pumps and interior fan coil units. Typical VRF heat pumps for office buildings of this size would generate noise levels around 58 to 68 dBA at a distance of 3 feet. Noise from mechanical equipment would typically drop off at a rate of about 6 dBA per doubling of distance. Outdoor heat pumps would be located on the building rooftop. For rooftop equipment, shielding from the rooftop and additional screens would be anticipated to provide 10 to 15 dBA of noise reduction, assuming the screen/rooftop would be constructed without any gaps or cracks. Any sound barriers should have a minimum surface weight of 3 pounds per square foot (such as 1-inch-thick wood, ½-inch laminated glass, masonry block, concrete, or metal one-inch).

The property lines for residential and civic land uses nearest to the likely locations for HVAC equipment are located at residences approximately 65 feet to the west, residences approximately 70 feet to the east, and the Wade Johnson Playground approximately 20 feet to the north. One commercial use, the Oakland Housing Authority office building, is located approximately 250 feet to the south. The most restrictive standard for operational noise as established in the City of Oakland Noise Ordinance limits operational noise sources at receiving residential and civic land uses to 60 dBA L_{33} during daytime hours, and 45 dBA L_{33} during nighttime hours. The L_{33} metric represents a noise level that is exceeded for one-third of any given hour (i.e., 20 minutes). Noise from HVAC equipment is stable when operating, so the average noise levels for VRF heat pumps can be applied to this standard.

Without considering shielding and attenuation from rooftops and parapet walls, noise from VRF heat pumps would not be expected to exceed 45 dBA beyond a distance of 46 feet from the equipment, or to exceed 60 dBA beyond a distance of 11 feet from the equipment. VRF equipment would not exceed daytime noise limits at any surrounding land uses. Under worst-case placement conditions, nighttime operation of VRF equipment could potentially exceed the noise limit of 45 dBA L_{33} at the Wade Johnson Playground. However, the City of Oakland Parks and Recreation Advisory Commission has established park hours at the Wade Johnson Playground to be from dawn to dusk, and therefore the park would not be used during nighttime hours.

This is a less than significant impact.

Generator Testing

A data center used by OUSD would be relocated from the existing Cole Middle School building to the new building. Continuous operation of data centers is ensured through use of emergency backup generators. The Project proposes to include a 150 kW Cummins QSB7-G5 diesel backup generator at the southwestern corner of the site. The generator would be housed in a level-2 sound enclosure and surrounded by a 12-inch thick, 15-foot high CMU wall. Testing of generators is typically considered an operational noise source.

Sound data for the generator was made available and analyzed. When equipped with the level-2 sound enclosure, testing of the generator at full capacity would result in a noise level of 73 dBA at a distance of 23 feet. Based on noise modeling in SoundPLAN, the 15-foot CMU wall surrounding the generator is anticipated to provide a noise reduction of about 17 dBA, resulting in a noise level during testing at full capacity of 56 dBA at a distance of 23 feet. The nearest noise-sensitive land uses to the generator are residences to the west and south, with property lines located approximately 75 feet from the center of the generator enclosure. At this distance, noise from generator testing is anticipated to reach approximately 47 dBA. Generator testing is typically only conducted during daytime hours and for a period of 15 minutes to two hours. With the level-2 sound enclosure and 15-foot CMU wall surrounding the generator, noise from generator testing would not exceed any daytime noise limits set in the City of Oakland Noise Ordinance.

This is a less than significant impact.

Parking Lot

Two parking lots totaling approximately 100 spaces would be located at the site, including one small lot near the entry and one larger lot along 10th Street. The parking lots would be located approximately 70 feet from the property lines of the nearest noise-sensitive land uses, which include residences to the east and west and the Oakland Housing Authority office building to the south.

Noise sources associated with the use of the parking lots would include vehicular circulation, engines, car alarms, squealing tires, door slams, and human voices. The sound of engines starting, doors slam closing, and people talking in a parking lot typically reach maximum levels of 50 to 60 dBA L_{max} at a distance of 50 feet. Parking lot noise would generate maximum noise levels in the range of 47 to 57 dBA L_{max} at a distance of 70 feet, not taking any shielding from terrain into account. The hourly average noise level resulting from all these noise-generating activities in the Project's parking lots would be anticipated to reach 40 dBA Leq at a distance of 50 feet from the parking areas. This parking lot noise would likely occur multiple times throughout the day, including:

- Between 8:30 and 9:30 a.m., when as many as 70 office employees and approximately 100 students for morning Adult/Continuing Ed. classes arrive
- Between noon and 1:00 p.m., when 100 students attending morning Adult/Continuing Ed. classes depart, and 100 other students for afternoon Adult/Continuing Ed. classes arrive
- Between 3:30 and 4:30 p.m., when 100 students for afternoon Adult/Continuing Ed. classes depart
- Between 5:00 and 6:00 p., when 70 office employees depart, and 175 students for evening Adult/Continuing Ed. classes arrive
- Between 7:30 and 8:30 p.m., when 175 students for evening Adult/Continuing Ed. classes depart

However, the maximum noise levels generated in the parking lots at each of the daytime use periods would be lower than existing maximum noise levels generated by the California Cereal Products industrial site, and would be below the daytime threshold established by the City of Oakland Noise Ordinance. The parking lot noise generated during the evening hours would also be below the maximum

allowable noise levels (in dBA Leq) established by the City of Oakland Noise Ordinance, which are 60 dBA L_{33} (or for 20 minutes) during a 1-hour period during the daytime between 7:00 a.m. and 10:00 p.m.

This is a less than significant impact.

Permanent Noise Increases from Project Traffic

Trip generation numbers were provided for the Project by Fehr & Peers, transportation consultants for this CEQA document. Traffic noise increases resulting from daily operations and peak hour operations were modeled in the Federal Highway Administration's (FHWA) Traffic Noise Model 2.5 (TNM). Based on traffic noise modeling, the Project may generate a traffic noise level of approximately 53 dBA Leq at 50 feet during the most busy p.m. peak-hour period (between 5:00 and 6:00), when 70 office employees depart and as many as 175 students for evening classes arrive.

When added to measured ambient noise levels of 59 dBA Leq at 5:00, the Project's traffic noise results in a combined ambient noise level of 60 dBA Leq, or a 1 dBA increase. When added to measured ambient noise levels of 62 dBA Leq at 6:00, the Project's traffic noise results in a combined ambient noise level of 62.5 dBA Leq, or a 0.5 dBA increase. Conservatively assuming a similar traffic noise generated by the Project during the evening departure time of 8:00, when the measured ambient noise level is only 57 dBA Leq, the Project's traffic noise results in a combined ambient noise level of 58.5 dBA Leq, or a 1.5 dBA increase. Under any of these peak period conditions, Project-generated traffic would not result in noise increases above the City's threshold of a 3-dBA increase.

Traffic resulting from earlier daily operations would not measurably increase noise levels in vicinity, as the ambient noise is dominated by industrial noise, and relatively small increases in roadway traffic would not be noticeable above the dominant industrial noise from the California Cereal Products facility.

This is a less than significant impact.

Exposure to Excessive Groundborne Vibration

Construction of the Project may generate perceptible vibration when heavy equipment or impact tools (e.g. jackhammers, hoe rams, etc.) are used in areas adjacent to developed properties. Construction activities would include demolition of existing structures, excavation, parking lot renovation and new construction.

The California Department of Transportation recommends a vibration limit of 0.3 in/sec PPV for buildings that are found to be structurally sound and designed to modern engineering standards, and a vibration limit of 0.25 in/sec PPV for historic and older buildings. The nearest historic building to the site is the Herbert Hoover House (an Oakland Landmark) located approximately 1,000 feet to the east at 1079 12th Street.

Project construction activities such as excavation, the use of jackhammers, rock drills and other high-power or vibratory tools, and rolling stock equipment (tracked vehicles, large haul trucks, compactors, etc.) may generate vibration in the immediate vicinity of the work area. **Table 8** presents typical vibration levels that could be expected from different types of construction equipment at a distance of 25 feet, and calculated vibration levels at distances representative of nearby structures. Pile driving would not be used as a method of construction for the Project.

Table 8: Vibration Source Levels for Construction Equipment

Equipment		PPV at 25 ft. (in/sec)	PPV at 55 ft. (in/sec)	PPV at 75 ft. (in/sec)	PPV at 1,000 ft. (in/sec)
Clam shovel drop		0.202	0.085	0.060	0.003
Hydromill (slurry wall)	in soil	0.008	0.003	0.002	0.000
	in rock	0.017	0.007	0.005	0.000
Vibratory Roller		0.210	0.088	0.063	0.004
Hoe Ram		0.089	0.037	0.027	0.002
Large bulldozer		0.089	0.037	0.027	0.002
Caisson drilling		0.089	0.037	0.027	0.002
Loaded trucks		0.076	0.032	0.023	0.001
Jackhammer		0.035	0.015	0.010	0.001
Small bulldozer		0.003	0.001	0.001	0.000

Source: Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, September 2018 as modified by Illingworth & Rodkin, Inc., April 2022

Vibration levels would vary depending on soil conditions, construction methods and equipment used. Residences are located as close as about 55 feet from the eastern property line of the site and 75 feet from the western and southern property lines of the site. At these distances, vibration levels resulting from the heaviest equipment use (clam shovel drop and vibratory rollers) would be expected to be about 0.085 to 0.088 in/sec PPV, which would be well below the 0.3 in/sec PPV limit recommended by the California Department of Transportation. Vibration levels at the historic Herbert Hoover House (about 1,000 feet away) are not expected to exceed 0.004 in/sec PPV and would not exceed any recommended limits.

This is a less than significant impact.

Airport Noise

The Project site is not subject to excessive noise from private airstrips, public airports or overhead aircraft. The nearest airport is the Oakland International Airport, about 6.5 miles to the southeast. Noise contours generated by aircraft arrival and departures at this airport do not extend as far as the Project site, and this would not be an impact for the Project.

Suitability of the Exterior Noise Environment (on-CEQA analysis)

CEQA does not require analysis or mitigation of effects that the existing environment may have on a project (with certain exceptions). Accordingly, this CEQA document presents the following analysis of the effects that ambient noise conditions may have on the Project for informational purposes, and to address questions of General Plan policy consistency, but does not identify these effects as significant impacts of the Project pursuant to CEQA.

The exterior noise environment at the Project site is primarily the result of operations at the California Cereal Products industrial facility. This analysis assumes that noise resulting from activity at this industrial site will continue in the future, and not substantially change from existing measured levels. Based on measurement data, noise levels throughout the site are dependent on distance from the industrial site to the north. Noise levels range from 62 dBA Ldn along the southern property line and increase to about 74 dBA Ldn along the northern property line, and the center of the proposed Cole Administration/Education building would fall in the range of about 68 dBA Ldn. This is within the 'conditionally acceptable' range of noise levels specified for school and office land uses per the State of California General Plan Guidelines (OPR, 2003) and per the City of Oakland General Plan.

Exterior Noise

Project plans indicate the potential for a small playground space at the northeastern corner of the site. This location is next to the existing Wade Johnson Playground. Given the proximity of the California Cereal Products industrial site, mitigating outdoor noise at this play space, particularly at the northern end of the Project site, is not practical. To adequately shield the playground space from ambient industrial noise such that the day-night noise level would not exceed the 'normally acceptable' criterion of 65 dBA Ldn, the playground would have to be substantially (if not fully) enclosed. Revising the site plan to relocate the playground to the southern end of the site along 10th Street would have the potential to reduce the noise level to below the 65-dBA Ldn criterion, but would diminish the function of the playground by no longer being adjacent to the Wade Johnson Playground and may also be considered impractical. No exterior noise mitigation is available, but it is worth noting that the Wade Johnson public park does not provide noise mitigation either.

Interior Noise Environment

The Cal Green Code requires that interior noise levels attributable to exterior sources not exceed 50 dBA Leq (1-hr) in occupied areas of non-residential uses during any hour of operation. Based on the results of the noise monitoring survey, peak-hour noise levels at the site are about 3 dBA higher than day-night average levels, and range between 65 dBA Leq (1-hr) at the southern end of the site to 77 dBA Leq (1-hr) at the northern end of the site. The greatest noise exposure would occur along the northern façades of the Proposed Cole Administration/Education building. Floorplans for the first and second floors indicate that rooms along the northern façades of the proposed building would include noise-sensitive uses such as offices, conferences rooms, and classrooms.

Noise levels along the northern façades of the building during the peak hour are expected to reach up to 77 dBA Leq (1-hr). A minimum exterior-to-interior noise reduction of 27 dBA would be required to ensure compatibility with the Cal Green Code standard of 50 dBA Leq (1-hr). Standard office construction with windows in the closed position typically provides for a noise reduction of about 25 dBA, with noise-rated construction materials being required to achieve a greater reduction. Preliminary calculations were made based on building elevations. Rooms near the center of the northern façade would feature large windows resulting in a window-to-wall ratio of up to 48%. Considering this and metal panel exterior wall construction, windows with a minimum Sound Transmission Class (STC) rating of 30 would be required along the northern façade of the Cole Administrative/Education Center building in order to provide the noise reduction necessary to meet the Cal Green Code standard of 50 dBA Leq (1-hr). Due to shielding provided by the proposed building and attenuation resulting from an increased distance from the California Cereal Products industrial site, noise levels along eastern, western, and southern façades of Project buildings are not expected to exceed 75 dBA Leq (1-hr), and therefore standard construction with windows in the closed position would be sufficient. Forced-air mechanical ventilation would be required to allow occupants to keep windows closed to control noise. The Project has no proposed operable windows.

Recommended Measures

Non-CEQA Recommendation Noise-4, Ventilation System for Closed Windows: Provide all occupied areas of the proposed building with a forced-air mechanical ventilation system to allow windows to be closed to control noise at the occupant's discretion.

Non-CEQA Recommendation Noise-5, Sound-Rated Building Treatments: Special building techniques (e.g., sound-rated windows and building façade treatments) are required to maintain interior noise levels along the northerly façade of the building at or below acceptable levels.

1. These treatments would include, but are not limited to, sound-rated windows and doors, sound-rated wall construction, acoustical caulking, and protected ventilation openings.

2. Preliminary calculations indicate that rooms located along the northern façade of the proposed building would require windows with a minimum STC rating of 30 to ensure that the 50 dBA Leq (1-hr) Cal Green Code standard is met.

Population and Housing

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	❒	❒	■	❒
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	❒	❒	❒	■

Population Growth

The Project would provide new building space to accommodate OUSD administrative staff and educational classrooms that are currently occupying other office or school space within the city. The Project offers an opportunity to consolidate its administrative function into one coordinated location, and to free-up other classroom space currently used for the Adult and Career Education program for other OUSD functions. The Project would not induce substantial unplanned population or employment growth, and the impact on population growth would be less than significant.

Housing

The Project site contains currently unused OUSD buildings related to a former middle school, and does not contain any existing housing units or residences. The Project would not displace existing housing or people, would not require construction of replacement housing elsewhere, and no impact would occur.

Public Services

Would the Project	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services?				
a) Fire protection	❒	❒	■	❒
b) Police protection	❒	❒	■	❒
c) Schools	❒	❒	■	❒
d) Parks	❒	❒	■	❒
e) Other public facilities	❒	❒	■	❒

Public Services

Development of the Project would slightly increase the demand for local fire and police service and result in an associated increase in service calls, but not to an extent that would result in the need for new or physically altered fire or police protection facilities. The Project would be subject to the policies, regulations, and standards of the City of Oakland, including appropriate standards for emergency access roads, emergency water supply, and fire preparedness, capacity, and response. The Project would not substantially increase the permanent population and would not substantially affect other public services such as schools or libraries. Impacts related to public services would be ***less than significant***.

Recreation

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	❒	❒	■	❒
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	❒	❒	■	❒

Recreational Facilities

Development of the Project would not result in a substantial increase in the demand for recreational facilities. The Project includes no new housing, and users of the Project's OUSD offices and Oakland Adult and Career Education classrooms would not be expected to use the adjacent Wade Johnson Park for purposes other than periodic light recreation or leisure purposes. These types of limited uses of the adjacent park would not result in substantial physical deterioration of the park, or accelerate deterioration of the park.

The Project does not include construction of large-scale recreational facilities or require the expansion of recreational facilities. Therefore, the Project would have a less than significant impact on recreation facilities, or on the physical environment resulting from construction or expansion of recreational facilities.

Transportation

Since OUSD does not have its own thresholds of significance, this document relies on the following City of Oakland's thresholds of significance to determine if the Project would have a significant impact on the environment: **Would the Project:**	**Potentially Significant Impact**	**Less Than Significant With Mitigation**	**Less Than Significant Impact**	**No Impact**
a) Cause substantial additional VMT per capita, per service population, or other appropriate efficiency measure?				
b) Conflict with a plan, ordinance, or policy addressing the safety or performance of the circulation system, including transit, roadways, bicycle lanes, and pedestrian paths (except for automobile level of service or other measures of vehicle delay)?				
c) Substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow lanes) or by adding new roadways to the network?				

Information for this section of the Initial Study has been derived from the following primary source:

- Fehr & Peers, Cole Administrative Center/Education Project – Transportation Assessment, April 25, 2022 (**Appendix K**)

Trip Generation

Trip generation is the process of estimating the number of motor vehicles that would likely access the Project on a typical day. **Table 9** summarizes the trip generation for the Project. Overall, the Project is estimated to generate about 710 daily trips, and 94 AM and 133 PM peak hour trips on a typical weekday. The trip generation characteristics for the Project on a typical weekday are described below.

- *Adult and Career Education Program* – Since applicable published data for this type of use is not available, the trip generation is estimated based on the expected number of students and faculty at the site, with full occupancy of the site as described in the Project Description.
- *Administrative Office Uses* - Trip generation data published by the Institute of Transportation Engineers (ITE) in the *Trip Generation Manual* (11th Edition) for School District Office is used to estimate the trip generation for the administrative office uses.

Table 9: Project Automobile Trip Generation Summary

Land Use	Size	Daily Trips	Weekday AM Peak Hour			Weekday PM Peak Hour		
			In	Out	Total	In	Out	Total
Adult and Career Education Program[1]	375 students and faculty	940	100	10	110	175	18	193
Administrative Office[2]	27,400 square feet	400	50	16	66	10	47	57
Subtotal		*1,340*	*150*	*26*	*176*	*185*	*65*	*250*
Non-Auto Reduction[3]		*-630*	*-70*	-12	-82	-87	-30	-117
Adjusted Total Automobile Trips		**710**	**80**	**14**	**94**	**98**	**35**	**133**

Notes:

1. Based on the following assumptions:

Daily: assume 2.5 trips per person per day
AM Peak Hour: all morning class attendees arrive and about 10 percent leave during the AM peak hour
PM Peak Hour: all evening class attendees arrive and about 10 percent leave during the PM peak hour

2. ITE Trip Generation (11th Edition) land use category 538 (School District Office, General Urban/Suburban):

Daily: T = 14.72 * X -6.60
AM Peak Hour: T = 2.50 * X – 2.81 (76% in, 24% out)
PM Peak Hour: T = 2.19 * X – 2.81 (17% in, 83% out)

3. Reduction of 46.9% assumed, based on City of Oakland TIRG, based on Census data for an urban environment within 0.5 miles of a BART station.

Source: Fehr & Peers, 2022

The estimated trip generation for the Adult and Career Education Program assumes that all students and faculty would drive to and from the site. In addition, the ITE data is primarily based on data collected at single-use suburban sites where the automobile is often the only travel mode. However, the Project site is located near local and regional transit service in an area where many trips are walk, bike, or transit trips. Since the Project is about 0.5 miles from the West Oakland BART Station, this analysis reduces the trip generation by 47 percent to account for the non-vehicular trips. This adjustment is consistent with the City of Oakland's *Transportation Impact Review Guidelines* (TIRG, April 2017) and is based on US Census commute data for Alameda County from the 2014 5-Year Estimates of the American Community Survey (ACS), which shows that the non-automobile mode share for urban areas within 0.5 miles of a BART Station is about 47 percent.

Parking Demand

Table 10 summarizes the estimated parking demand for the Project site on a typical weekday based on the maximum occupancy of the site as described in the Project Description and the number of people expected to drive to and from the site as described in the Trip Generation section of this memorandum. It is estimated that the 93 off-street parking spaces provided by the Project would meet the parking demand generated by the Project employees and students during both daytime and nighttime on a typical weekday. It is expected that the site visitors would use on-street parking on the adjacent streets because the Project parking lots would be at or near capacity when the site is fully occupied.

Table 10: Project Automobile Parking Demand Summary

Use	Daytime		Nighttime	
	Population[1]	Parking Demand[2]	Population[1]	Parking Demand[2]
Adult and Career Education Program	100	53	175	93
Administrative Office	70	37	0	0
Total	170	90	175	93
Parking Supply		93		93
Parking Surplus		+3		0

Notes:

1. Population estimates provided by OUSD

2. Assuming that 53 percent of the population would drive to the site, consistent with the City of Oakland TIRG, using Census data for an urban environment within 0.5 miles of a BART station

Source: Fehr & Peers, 2022

Cause Substantial Additional Vehicle Miles Traveled

According to the City of Oakland TIRG, the following are thresholds of significance related to substantial additional VMT:

- For residential projects, a project would cause substantial additional VMT if it exceeds existing regional household VMT per capita minus 15-percent.
- For office projects, a project would cause substantial additional VMT if it exceeds the existing regional VMT per worker minus 15-percent.
- For retail projects, a project would cause substantial additional VMT if it results in a net increase in total VMT

Consistent with the State Office of Planning and Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018), City of Oakland uses screening criteria that can be used to quickly identify projects that can be expected to cause a less-than-significant impact on VMT without conducting a detailed study. The City of Oakland TIRG includes several screening criteria. The criterion applicable to the Project is Criterion #2, Low-VMT Area, which states that VMT impacts would be less-than-significant for a project if the following screening criterion is met:

- Low-VMT Areas: The project meets map-based screening criteria by being located in an area that exhibits below-threshold VMT, or 15 percent or more below the regional average.

The City of Oakland uses the Metropolitan Transportation Commission (MTC) Travel Model to apply the Low-VMT Areas criterion. The MTC Travel Model assigns all predicted trips within, across, or to/from the nine-county San Francisco Bay Area region onto the roadway network and the transit system by mode (single-driver and carpool vehicle, biking, walking, or transit) and transit carrier (bus, rail) for a particular scenario. The MTC Travel Model estimates VMT per resident and VMT per worker for transportation analysis zones (TAZs) throughout the modeled area. TAZs are geographic areas that vary in size from a few city blocks in dense downtown areas, to larger geographic areas in lower-density areas.

The City of Oakland TIRG recommends treating educational land uses (K-12 schools and post-secondary institutions) as office uses for VMT screening and analysis. The VMT per worker, as estimated by the MTC Model, is applicable to both Project components (the Adult and Career Education Program and the Administrative Office).

Table 11 shows the estimated VMT per worker for TAZ 985, the TAZ in which the Project is located. This table also shows the applicable VMT threshold as being 15 percent below the regional average. The average daily VMT per worker in the Project TAZ (TAZ 985) is 17.8 miles. The regional average daily VMT per worker is 21.8 miles, and the threshold (15 percent below the regional average) is 18.5 miles. The average daily VMT per worker in the Project TAZ (17.8 miles) is more than 15 percent below the regional average, satisfying the Low-VMT Area criterion. In addition, the Adult and Career Education Program component of the Project would continue to serve primarily West Oakland and the surrounding areas. Since OUSD operates similar Adult and Career Education Programs at other sites throughout the City of Oakland, the Project is considered local serving.

Table 11: Project VMT Summary

Geographic Area	Total VMT per Worker (2020)[1]
Project TAZ (TAZ 985)	17.8
Bay Area Region Average	21.8
Bay Area Region Average minus 15% (i.e., threshold of significance)	18.5
Significant Impact?	***No***

Notes: 1. MTC Model results at www.arcgis.com/apps/webappviewer/index.html?id=98463b4f73ca43c5944a5c30648fd689 , accessed in March 2022

Source: Fehr & Peers, 2022

Since the Project would satisfy the City of Oakland's Low-VMT Area criterion, and the Adult and Career Education Program component of the Project is considered local serving, the Project is presumed to have a less-than-significant impact on VMT.

Conflicts with Plans, Ordinances or Policies Relating to Circulation System Safety or Performance

The Project would not cause a significant impact by conflicting with adopted plans, ordinances or policies addressing the safety and performance of the circulation system, including transit, roadways, bicycle lanes and pedestrian paths.

Various City of Oakland's plans and policies, such as the City's General Plan, the Equitable Climate Action Plan, and the Public Transit and Alternative Mode and Complete Streets policies, state a strong preference for encouraging the use of non-automobile transportation modes such as transit, bicycling and walking. The Project would encourage the use of non-automobile transportation modes by being located in a medium-density, walkable urban environment and within 0.5 miles of both local and regional transit. It is expected that more than half of the Administrative Office employees assigned to the Project would work remotely on typical weekdays, further reducing the automobile trips generated by the Project.

The Project would not make any modifications to the existing pedestrian or bicycle facilities in the surrounding areas, including the existing BayWheels bike-share station located on Union Street along the Project frontage just north of 10th Street. Although the 2017 City of Oakland Pedestrian Master Plan (Oakland Walks!) and the 2019 Oakland Bike Plan (Let's Bike Oakland) do not identify any future facilities along the streets adjacent to the Project, the Project would not adversely affect installation of any planned facilities. The Project would not make any major modifications to the public right-of-way or include features that would adversely affect installation of potential facilities in the future. The Project

would provide long-term bicycle parking for Project employees within the Project building, and short-term bicycle parking for students and visitors in the form of bike racks in the Project parking lot.

Project construction activities could potentially temporarily disrupt transportation, bicycle, and/or pedestrian movement, as well as reduce parking availability in the Project area.

Mitigation Measures

The following mitigation measures are recommended to address temporary disruptions in transportation during the construction and soil remediation process:

Mitigation Measure Transportation-1, Traffic Control Plan: The District shall prepare and implement a Traffic Control Plan during the construction and soil remediation process. The Traffic Control Plan shall contain a set of comprehensive traffic control measures for auto, transit, bicycle and pedestrian accommodations (or detours, if accommodations are not feasible). These traffic control measures should include an overall construction logistics plan with designated construction access routes, construction worker parking plan and construction phasing plan, proposed truck routes, detour signage and lane closure procedures (if required), signs or cones for driver safety, and a pedestrian safety plan. The Traffic Control Plan shall be in conformance with the City of Oakland's Supplemental Design Guidance for Accommodating Pedestrians, Bicyclists and Bus Facilities in Construction Zones.

Resulting Level of Significance

Implementation of the above mitigation measure would ensure that the Project construction activities would not excessively disrupt motor vehicle, bicycle, and/or pedestrian circulation, and this impact would be reduced to a level of less than significant.

The Project is otherwise consistent with applicable transportation plans, ordinances and policies. The Project would have a less than significant impact pertaining to conflicts with other adopted transportation plans, ordinances or policies.

Substantially Induce Automobile Travel

The Project would not modify the roadway network surrounding the Project site. Therefore, the Project would not substantially induce additional automobile travel by increasing the physical roadway capacity in congested areas (i.e., by adding new mixed-flow lanes). The Project would not add new roadways to the network, and would have a less-than-significant impact on inducing additional automobile traffic.

Tribal Cultural Resources

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	❒	❒	■	❒

Tribal Cultural Resources

The Project site is not listed or identified as eligible for listing in the California Register of Historical Resources or in a local register of historical resources as a known location of significant tribal cultural resources. The District (as Lead Agency) is not aware of any substantial evidence that would support a determination that the site is considered a significant resource to a California Native American tribe.

Pursuant to this CEQA documentation, the District's consultant requested a search of the Native American Heritage Commission's Sacred Lands File, and that search concluded with a positive result for the Project area (see **Appendix C**). If a Sacred Lands Inventory search has a positive result, the NAHC provides a list of California Native American Tribes that have traditional and cultural affiliation to the area, so that the CEQA lead agency may consult with the Tribes on the Project. Pursuant to AB 52, the District's consultant's conducted outreach (via letters dated February 12, 2020 – see Appendix C) to those Native American Tribes listed as traditionally and culturally affiliated to the Project area. Follow up calls were made on February 18, 2020, all with no response. To date, no requests for consultation have been received from the tribes, and no tribal concerns or tribal cultural resources have been identified. [33]

Mitigation Measures

In the unlikely event of tribal cultural resources being discovered during the Project's grading and construction period, the following mitigation measures would be required:

[33] PaleoWest Archaeology, "Archaeological Review in Support of the Central Administration Center at Cole Campus, Alameda County, California", March 9, 2020 (Appendix C)

Mitigation Measure Cultural-2: Inadvertent Discoveries (see Cultural Resource section of this Initial Study)

Mitigation Measure Cultural-3: Inadvertent Discovery of Human Remains (see Cultural Resource section of this Initial Study)

1. The County Coroner, upon recognizing any remains as being of Native American origin, is responsible to contact the NAHC within 24 hours. The Commission has various powers and duties, including the appointment of a Most Likely Descendant (MLD) to the Project. The MLD, or in lieu of the MLD, the NAHC, has the responsibility to provide guidance as to the ultimate disposition of any Native American remains.

Utilities and Service Systems

Would the Project	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	❒	❒	■	❒
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	❒	■	❒	❒
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	❒	❒	■	❒
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	❒	■	❒	❒
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?				

Construction of New Utilities and Connections

Water

The Project would install a new 3" water service to provide domestic potable water to the new building. This water service line would be connected via an existing 4" water meter for domestic water point of connection to the existing 8" water main within the 10th Street right-of-way.

Water needed for fire service would include construction of a new 6" fire service water line providing fire service water to the new building, connected to the existing 8" water main within the 10th Street right-of-way. The Project would also include installation of 4 new fire hydrants. These new hydrants include 2 fire hydrants along Union Street connected to an existing 8" water main in Union Street, 1 hydrant connected to the existing 8" water main in 10th Street, and installation of a 6' water main extension from 10th Street to Poplar Street, to serve a new fire hydrant off Poplar Street.

Water service to provide outdoor irrigation needs for the Project would be provided via a connection to an existing 2" water meter, which is currently connected to the existing 8" water main within the 10th Street right-of-way.[34]

[34] Shah Kawasaki Architects and Siegfried Engineers, Utility Plan, Sheet C-105 of Central Administration Center at Cole Campus submittal to State Architects, February 19, 2021

Sanitary Sewer

The Project would install two sanitary sewer lines under the on-site sidewalk along Poplar Street, including a 6" sewer line from the south and a 3" sewer line from the north. Both of these new sanitary sewer lines would connect to an existing 10" sanitary sewer main within the Poplar Street right-of-way.

Storm Drain

Pursuant to NPDES c.3 requirements, the Project includes a stormdrain system that captures stormwater form rooftops and hardscape surfaces, and directs this stormwater through a series of biofiltration basins for water quality treatment prior to discharge into the existing storm drain mains. The stormdrain system flows in two separate directions based on the final grade of the Project site. One system serves the southerly portion of the site and another system serves the northerly portion of the site. After stormwater receives water quality treatment, flows from the southerly portion of the site will be routed via a new 12" stormdrain system to an existing 15" stormdrain main in the 10th Street right-of-way. Flows from the northerly portion of the site will be routed via new stormdrain lines to an existing 12" stormdrain main at the northeast corner of the site at Union and 12th Street.

Electrical and Communications Service

All electrical, telephone and cable service to the Project will be provided via new connections to existing underground lines, generally located below the Union Street right-of-way.

Regulatory Requirements

All work within the public right-of-way necessary to provide connections to existing utility services will require an encroachment permit, issued by the City of Oakland. Contractors will be required to obtain such permits prior to working within the public right-of-way. All of these new utility services will also require on-site trenching to route new underground pipes and conduits. Trenching must be conducted in compliance with the DTSC-approved Remedial Action Workplan to ensure protection of workers and the environment from contaminated soil and groundwater. All new water and firewater service shall conform to all applicable East Bay MUD specifications, and the contractors are required to coordinate with EBMUD prior to making connections to the existing water mains. All other on-site utilities would be designed and connected in accordance with applicable codes and current engineering practices.

With implementation of all regulatory requirements related to installation utilities and service systems, impacts associated with the relocation or construction of new or expanded utility service facilities would be less than significant.

Water Supply

CEQA Guidelines section 15155 requires preparation of a Water Supply Assessment for any "water-demand project", which is defined as any project that would demand an amount of water equivalent to or greater than the amount of water required by a 500 dwelling unit project, which generally can be assumed at about 95,000 gallons per day (gpd).[35]

Based on indoor water demand factors of 52 gallons/employee/day over 225 days per year for the Project's office space, and 8.8 gallons/student/day over 180 days per year for the Project's "other" school use, the total unmitigated indoor water demands of the Project can be calculated at

[35] Assuming a total water demand of 190 gallons per day per unit (citywide average) x 500 dwelling units, a "water-demand project" is calculated as a project with a water demand of approximately 95,000 gallons per day.

approximately 6,010 gpd averaged over a year period.[36] Added to that would be the outdoor irrigation demand, averaged at approximately 905 gpd.[37] With a total average daily water demand of approximately 6,915 gpd, the Project falls far short of meeting the definition of a "water demand project", and no Water Supply Assessment is required or has been prepared. Rather, the water demands of the Project are assumed included in the EMBUD Water Supply Management Program 2040 (2040 WSMP).

According to the EMBUD Urban Water Management Plan 2015 (UWMP), EBMUD was projected to have a year 2020 annual average demand of 267 million gallons per day (MGD), and a projected demand of 290 mgd by year 2030, or an increase of approximately 23 MGD over the course of that 10-year period.[38] The Project's estimated demand of 6,915 gpd represents only about 0.03% (three one-hundredths of a percent), or a very small fraction of EBMUD's projection of increased demand. Furthermore, EBMUD's existing 2020 water demands account for a baseline of nearly 2,000 gpd at the site. [39] With a net increase in daily water demand of approximately 5,100 gpd, the Project's water demands are well within the expected increase in water demands as presented in EBMUD's UWMP.

The EBMUD's UWMP concluded that, "*EBMUD must balance supply and demand to ensure that it meets customer water needs into the future. Both supply and demand can vary seasonally, and supply can decrease significantly during droughts which can last for several years. In order to have a diversified, robust water supply portfolio, EBMUD considers a variety of scenarios in its long-term planning. In spite of EBMUD's aggressive conservation and recycling programs, Mokelumne River and local watershed supply is not sufficient to meet 2040 customer demands during multi-year droughts without achieving potentially significant water use reductions. Depending on conditions, during such droughts, EBMUD may also need to acquire supplemental supplies to meet customer demands. However, with a combination of reductions in water use and acquisition of supplemental supplies, EBMUD can provide adequate water service in all year types*." [40]

Based on the above information, the Project will have sufficient water supplies available from EBMUD to serve its water demands and those of other reasonably foreseeable future development, during normal and multiple dry years.

Mitigation Measures

As noted above, the EBMUD 2040 WSMP concludes that a combination of rationing, conservation, and raw and recycled water, plus supplemental supply components, will be needed to keep rationing at a lower level and will satisfy cumulative customer water demands through the year 2040 in drought years. The following mitigation measures are identifies to address the Project's cumulative water demands in light of current and future drought-year conditions:

Mitigation Measure Utilities-1, Water Efficient Landscape: The Project applicant shall comply with California's Water Efficient Landscape Ordinance (WELO) in order to reduce landscape water usage,

---

36 Based on "Modeled" water demand factors presented in: Pacific Institute, "*Waste Not, Want Not, The Potential for Urban Water Conservation in California*", Appendix E: Details of Commercial Water Use and Potential Savings, by Sector, November 2003, for indoor uses only

37 Project Application materials, as shown on Sheet L-102, Siegfried, February 2021, based on an average of 329,543 gallons per year/365 days per year

38 EBMUD, *Urban Water Management Plan*, July 2016, Table 4-1 on page 52

39 East Bay Municipal Utility District (EBMUD), *2040 Demand Study, Water Supply Management Program 2040*, February 2009, uses 703 gpd/acre for school uses, times the 2.6-acre site, or approximately 1,830 gpd

40 EBMUD, *Urban Water Management Plan*, July 2016, page 54

including compliance with a Project-specific calculation of the Project's Maximum Applied Water Allowance.

The Project sponsor has prepared a comparison of projected irrigation water demands of the Project (estimated at 329,543 gallons per year), as compared to a Maximum Applied Water Allowance for the Project of 353,336 gallons per year, demonstrating compliance with this mitigation measure. [41]

Mitigation Measure Utilities-2, Green Building Requirements: The Project sponsor shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures for water conservation.

The Project sponsor has prepared a compliance matrix of the Project against the criteria of the California Collaborative for High Performance Schools (CA-CHPS), which demonstrates that the Project will comply with CALGreen Sections 5.303.3 and 5.303.6 regarding water demand reductions for indoor use, including a water demand reduction of at least 20%.

Resulting Level of Significance

As demonstrated above, the water provider (EBMUD) will have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years. With implementation of the Project's water demand reductions as presented in their CA-CHPS Checklist and Water Efficient Landscape calculation, the Project will further reduce its contribution to cumulative water demands, in compliance with these existing regulations. This impact is less than significant.

Wastewater Treatment

The City of Oakland's 2008 *Sanitary Sewer Design Guidelines* include average daily flow rates for specific types of development. These design standards provide that an Office use can be expected to generate 200 gpd/1,000 square feet of gross building space.[42] Based on the different types of uses within the Project, this design standard was applied separately to the office component (27,350 square feet used 225 days per year), and to the Adult Ed component (28,826 square feet, used 180 days per year). The net result is an annualized average of approximately 6,250 gpd, which is comparable to the indoor water demands of the Project as calculated above.

The EBMUD MWWTP can provide primary treatment for up to 320 MGD, and secondary treatment for a maximum flow of 168 MGD. However, the latest (year 2020) NPDES permit issued to the RWQCB limits average dry weather influent flow to the MWWTP 120 MGD. As of 2015, discharge rates from the MWWTP were approximately 53.8 MGD, leaving a potential increase of up to 66.2 MDG of discharge capacity. An increase of approximately 6,250 gpd of wastewater as generated by the Project represents a very small fraction (approximately 0.01 percent) of the remaining discharge capacity of the MWWTP. Furthermore, the Cole building was used as a middle school until 2009, and has since been occupied by various OUSD programs. The wastewater demands of the Project are assumed for this analysis as the total increase over a zero-use baseline, whereas the Project site has had wastewater flows to the MWWTP in the past. The Project's minor net increase in wastewater flows can be accommodated at the MWWTP, and is not substantial in the context of total wastewater flows processed at the MWWTP and disposed of into the Bay. EBMUD has sufficient capacity to treat and dispose wastewater flows from the Project, and construction of new wastewater treatment facilities or expansion of existing facilities would

[41] Shah Kawasaki Architects and Siegfried Engineers, Sheet L-102, of Central Administration Center at Cole Campus submittal to State Architects, 2021

[42] City of Oakland Department of Engineering and Construction, Sanitary Sewer Design Standards, August 2008, Table 1

not be needed. As such, the Project would have a less than significant impact on wastewater treatment and disposal facilities.

Regulatory Requirements / Mitigation Measures

To ensure that the Project's contribution of wet weather inflow to the treatment plant is minimized, the Project comply with EBMUD's Regional Private Sewer Lateral (PSL) Ordinance and City of Oakland ordinance for sewer laterals, by replacing or rehabilitating sanitary sewer lateral lines that serve the Project, constructed to City standards to prevent inflow and infiltration (I/I).

Storm Drainage Conveyance

Under current conditions, only about 6,675 square feet (or about 6%) of the site is covered by pervious lawn (the landscape strips surrounding three sides of the existing Cole Building), and the remaining approximately 104,345 square feet (or 94%) of the site is currently covered by impervious surfaces (i.e., the Cole Building, the Cafeteria building, the modular shed and asphalt). Under Project conditions, 23,373 square feet (or about 21%) of the site will be covered by pervious surfaces (landscaping and biotreatment areas), and the remaining approximately 87,647 square feet (or 79%) of the site will be covered by impervious surfaces (i.e., the new Cole Administration/Education Building, surface parking and sidewalks). Since the Project will be decreasing total pervious surface area on the site, the volume of stormwater runoff leaving the site will not be increased.

Whereas the existing stormdrain system is adequately accommodating existing site runoff under current conditions, this same stormdrain system will have adequate capacity to accommodate the lesser volume of site runoff under Project conditions. The impact of the Project on the surrounding stormdrain collection system will be less than significant.

Solid Waste

During construction of the Project, the demolition of existing structures and the removal of existing asphalt will result in approximately 230 truckloads of waste material to be hauled off site. During operations of the Project, new employees and students will generate waste materials, recyclables and compostable waste.

CalRecycle provides estimated solid waste generation rates (the amount of waste created by different land use types), which can be used to estimate the impact of new developments on the local waste stream. These waste generation rates include all materials discarded, whether or not they are later recycled or disposed of in a landfill. This data is not official CalRecycle information, but is useful in providing a general level of information for planning purposes. According to these cited sources, schools and offices can be estimated to generate approximately 1 pound of waste per student per day.[43] Using this waste generation rate, The Project (at 150 administrative personnel and 277 students) may generate approximately 427 pounds of waste per day.

Within Oakland, California Waste Solutions (CWS) provides recycling services, and Waste Management collects solid waste and yard trimmings. All of these materials are taken to the Davis Street Transfer Station in San Leandro, which has an average output of 2,027 tons per day.[44] The Project's incremental contribution of perhaps 427 pounds per day represents a very small fraction of the transfer station's average daily outflow. Similarly, the Altamont landfill has a permitted maximum disposal capacity of

---

[43] CalRecycle, https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates , sourced to: Draft Program EIR for Rye Canyon Business Park, Santa Clarita, citing SWANA Tech. Bull. 85-6; Recovery Sciences, 1987; and Santa Clarita SRRE 1990

[44] Alameda County Waste Management Authority (ACWMA), *Alameda County Integrated Waste Management Plan, Countywide Element*, as amended 2017, pg. II-26, -27

7,000 tons per day, and the Project's minimal contribution to landfill capacity is too small to calculate. The Project's impact on the capacity of local solid waste infrastructure would be less than significant.

Regulatory Requirements / Mitigation Measures

Irrespective of the Project's individual waste disposal demands, the Project will contribute to overall waste disposal and recycling demands within the City. To address these cumulative waste disposal and recycling demands, the Project will be subject to the following regulations and mitigation measures:

Mitigation Measure Utiities-3, Construction and Demolition Waste Reduction and Recycling: The Project sponsor shall comply with the City of Oakland Construction and Demolition Waste Reduction and Recycling Ordinance (chapter 15.34 of the Oakland Municipal Code) by preparing and implementing a Construction and Demolition Waste Reduction and Recycling Plan. That Plan shall specify the methods by which the project will divert construction and demolition debris waste from landfill disposal.

According to the compliance matrix prepared by OUSD for the Project against the criteria of the California Collaborative for High Performance Schools (CA-CHPS), the Project intends to achieve a 75% diversion of construction site waste from landfill disposal through recycling and other landfill disposal alternatives. The Compliance Matrix also demonstrated the District's intent to use recycled materials as part of the Project's new construction. The Project intends to use at least 20% recycled materials (as measured by overall materials cost), use rapidly recyclable materials for at least 50% for either flooring, casework, acoustic ceiling tiles or wall coverings, and use at least 50% of its wood product as FSC-certified wood.

Mitigation Measure Utilities-4, Recycling Collection and Storage Space: The Project sponsor shall comply with the City of Oakland Recycling Space Allocation Ordinance (chapter 17.118 of the Oakland Planning Code). For non-residential projects, at least two (2) cubic feet of storage and collection space per 1,000 square feet of building floor area is required, with a minimum of ten (10) cubic feet.

Project drawings reviewed and approved by the State Architect show a trash and recycle enclosure adjacent to the main parking lot, with a total enclosure of 319 square feet. Assuming a 4-foot high collection facility, the Project would provide as much as 1,276 cubic feet of collection space, at a ratio of 5.7 square feet per 1,000 square feet of building floor area, exceeding the City requirement.

Resulting Level of Significance

The Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. The Project would comply with federal, State and local management and reduction statutes and regulations related to solid waste, and this impact would be less than significant.

Wildfire

Would the Project:	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	❒	❒	❒	■
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	❒	❒	❒	■
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	❒	❒	❒	■
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	❒	❒	❒	■

Wildfire Risk

The Project site, which is located within an urbanized area of the City of Oakland, is not identified as within, nor is it near a Very High Fire Hazard Severity Zone (see **Figure 18**).[45] The Project site falls within a Local Responsibility Area and is under the jurisdiction of the Oakland Fire Department. The Project would have ***no impact*** related to wildfire risk and emergency response for lands in or near state Responsibility Areas or classified as Very High Fire Hazard severity zones.

[45] California Department of Forestry and Fire Protection. Fire Hazard Severity Zones Maps. Website accessed 2.28.20 at https://osfm.fire.ca.gov/media/5606/oakland.pdf

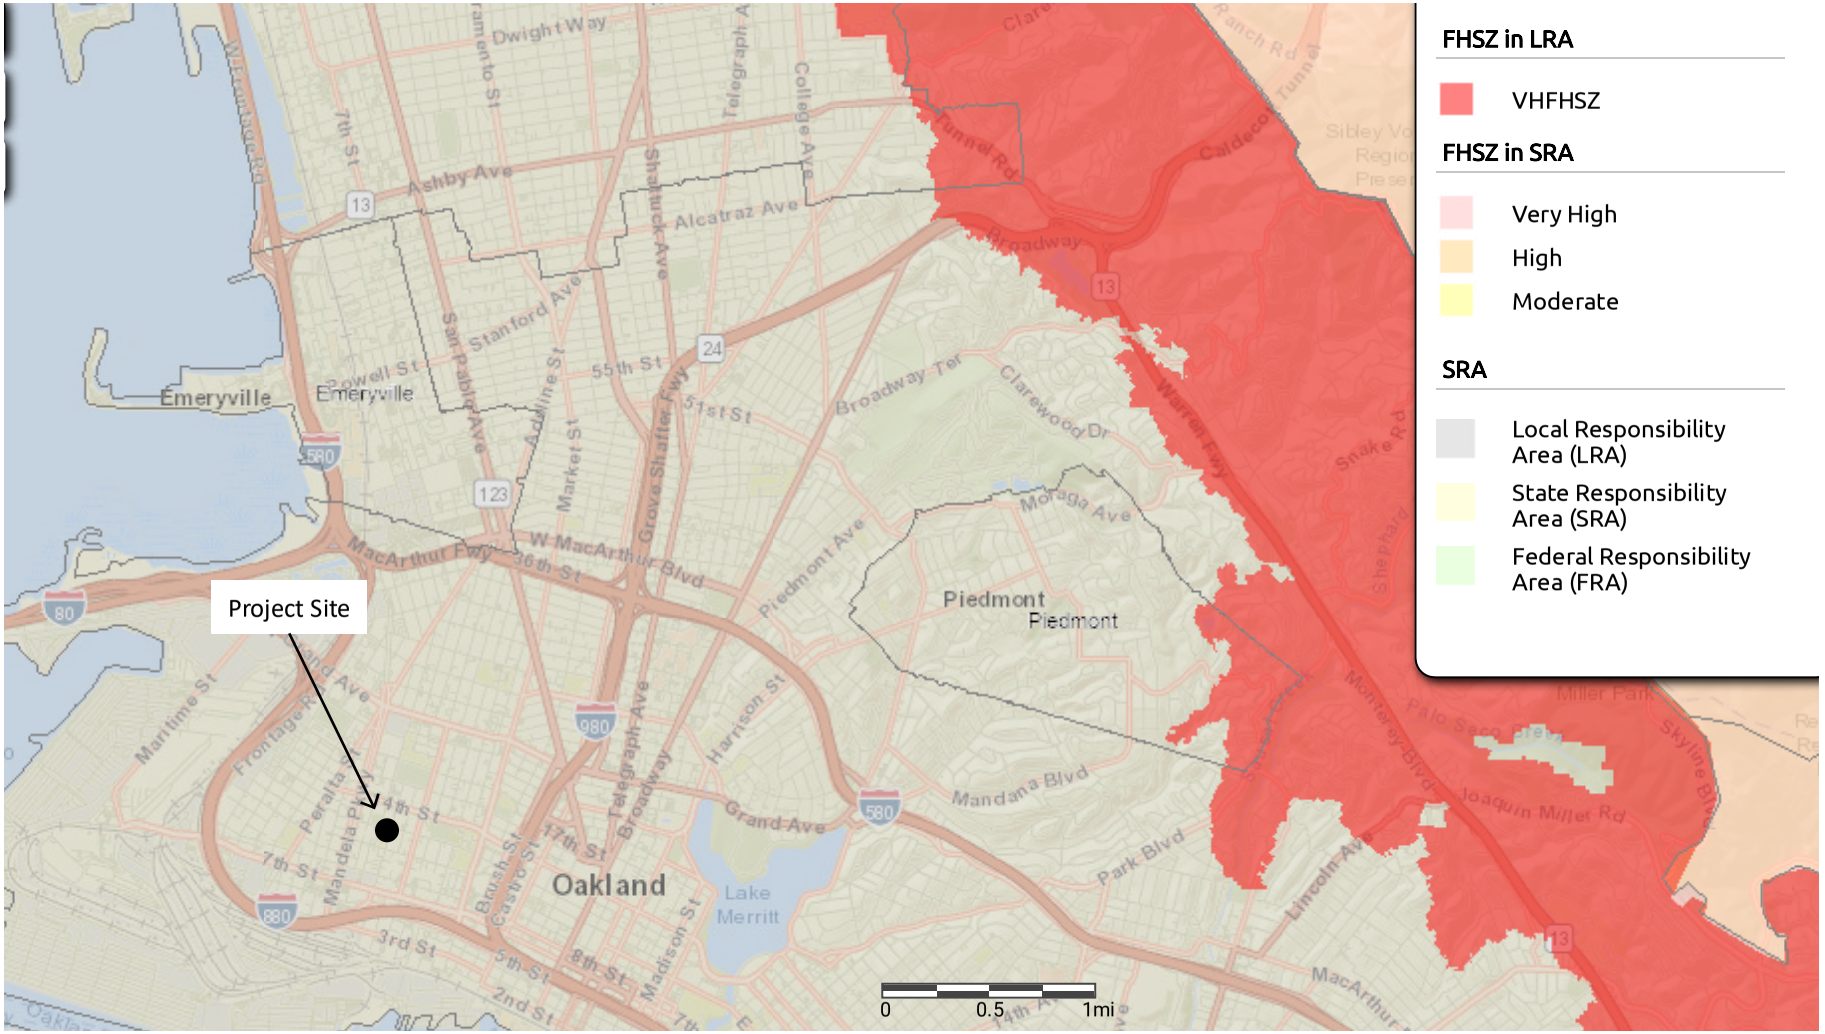

Figure 18
Fire Hazard Severity Zones in Relationship to Project Site

Mandatory Findings of Significance

		Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
a)	Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	❒	❒	■	❒
b)	Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	❒	■	❒	❒
c)	Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	❒	■	❒	❒

Degrade the Quality of the Environment

As addressed in the Air Quality, Biology, Hazards and Cultural Resources sections of this Initial Study Checklist:

- The Project site is located in an urban area that is fully developed. The site contains existing buildings and paved surface parking lots. On-site vegetation consists of shrubs and mature trees along the eastern perimeter of the site, and small grass-covered areas adjacent to boundary sidewalks. The potential for the Project to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species is less than significant. There are no riparian habitats, wetlands or other sensitive natural communities on the Project site or in the vicinity.
- Neither the Cole School building or the Cafeteria are listed in, nor do they appear to be eligible for the California Register. The subject property does not meet either of these criteria of the City of Oakland's definition of historical resources under CEQA. Development of the Project would not cause a substantial adverse change to an eligible historic resource, and the potential for direct or indirect impacts on historic resources would be less than significant.
- Construction-related subsurface disturbance of the Project site could potentially damage or destroy previously unidentified prehistoric archaeological resources. The potential to uncover Native American human remains exists in locations throughout California. Although not anticipated, cultural resources may be discovered during site-preparation and grading activities. With implementation of mitigation measures, potential adverse effects on as-yet undiscovered archaeological resources would be less than significant.
- The Project's construction-period emissions would not exceed the significance thresholds, and construction-period emissions of criteria pollutants would be less than significant. The Project's operational emissions would not exceed the significance thresholds for any of the identified

criteria air pollutants. Therefore, the Project's impact related to operational criteria pollutant emissions would be less than significant.

Based on these conclusions, the Project does not have the potential to degrade the quality of the environment. The Project would not substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten or eliminate a plant or animal community, or reduce the number or restrict the range of a rare or endangered plant or animal. The Project would not eliminate important examples of major periods of California history or prehistory.

Cumulative Impacts

As addressed in the Air Quality, GHG, Hydrology and Noise sections of this Initial Study Checklist:

- Construction activities associated with the Project would generate construction-related TAC emissions, specifically diesel particulate matter (DPM, as both PM10 and PM2.5) from on-road haul trucks and off-road equipment exhaust emissions. These emissions would contribute to ambient air quality emissions from nearby freeways, industrial sites, and the Port, potentially contributing to cumulative cancer risks and non-cancer health concerns at nearby sensitive receptors. With implementation of mitigation measures, the Project's emissions of toxic air contaminants would be reduced to levels of less than significant, and its contribution of toxic air contaminants would be a less than cumulatively considerable contribution to overall cumulative air quality.
- The City of Oakland's *2030 Equitable Climate Action Plan* (ECAP) sets forth a detailed, equitable path toward cost-effectively reducing Oakland's local GHG emissions by a minimum of 56% below baseline 2005 GHG emission levels by 2030, with the intent of ensuring that all of Oakland is resilient to the foreseeable impacts of climate change. Oakland's adopted 2030 reductions target of 56% below Oakland's 2005 GHG emissions reach beyond that of the State's 40% target. Based on the Project's general consistency with the City's ECAP Checklist criteria, as well as its CA-CHPS Scorecard that demonstrates the Project meets the criteria for CHPS-verified certification, the Project complies with applicable plans, policies and regulations adopted for reducing emissions of greenhouse gases, and this impact would be less than cumulatively significant.
- The Project will introduce new non-point sources of water pollutants such as automotive fluids, pesticides, fertilizers and herbicides used in landscaped areas, trash and excess irrigation water, and air pollutants deposited on rooftops and other impervious surfaces. These non-point sources of pollutants could enter the storm drainage system and eventually contribute to cumulative surface water-quality degradation. With implementation of a post-construction Stormwater Management Plan, the Project will provide adequate BMPs for the treatment of water quality in stormwater runoff from the Project site, and these BMPs will be installed, implemented and maintained in a manner that will reduce post-construction water quality impacts to acceptable, less than significant levels. The Project would be consistent with policies and regulations related to stormwater pollutants, reducing the potential for cumulative impacts to water quality to less than significant.
- Traffic resulting from daily operations of the Project would not measurably increase cumulative noise levels in the vicinity. The ambient noise conditions are dominated by industrial noise, and relatively small increases in roadway traffic attributed to the Project would not result in noise increases above the City's cumulative threshold of a 3-dBA increase.

Based on these conclusions, the Project would not have impacts that are individually limited, but cumulatively considerable.

Effects on Human Beings

As addressed in the Air Quality, Geology, Hazards, Noise and Wildfire sections of this Initial Study Checklist:

- Construction and soil remediation activities associated with the Project would generate construction-related TAC emissions, specifically diesel particulate matter (DPM, as both PM10 and PM2.5) from on-road haul trucks and off-road equipment exhaust emissions. Mitigation measures would be implemented to reduce the Project's contribution of toxic air contaminants during the construction period by ensuring that all off-road diesel equipment used during the construction period, and all haul trucks used for soil export and import for the Project, are equipped with the most effective Verified Diesel Emission Control Strategies (VDECS) available. Tier 4 engine standards have been found to reduce emissions of PM and NOx (including small PM emissions of DPM) by approximately 90%, as compared to Tier 2 and Tier 3 engines without such controls. With a 90% reduction in construction-period emissions of DMP, the Project's emissions of toxic air contaminants would be reduced to levels of less than significant.
- Based on detailed studies of the Project site, relatively high concentrations of lead and arsenic were detected in soil at the site that could pose a potential health hazard to future on-site receptors. Concentrations of organic chemicals were also detected in soil at the site that exceeds acceptable cancer risks. The preliminary approach for addressing these concerns at the site is anticipated to involve remediation of soil contaminated with lead and arsenic during the construction phase of the Project. Soil excavation and removal with off-site disposal is expected to be the preferred remedial action alternative. The District is required to enter into a Voluntary Cleanup Agreement or School Cleanup Agreement with DTSC, prepare a Removal Action Work Plan or Remedial Action Plan, including providing additional opportunities for public comment, and conduct all necessary cleanup activities pursuant to an approved Removal Action Work Plan or Remedial Action Plan. With full compliance with all DTSC-established procedures and protocols, threatened releases or potential releases of hazardous substance at or from the Project site will be fully investigated and remediated, such that the Project would not create a significant hazard to the public or the environment.
- The District will be required to prepare site-specific Health and Safety Plans and a Soil Management Plans (SMP) for DTSC approval prior to any work in Phase I and Phase II areas where contractors will be working in, or excavating soil. The SMP is to be implemented during future remediation excavation and construction activities to protect construction workers, site occupants and off-site receptors from potential exposure to lead and arsenic in the soil.
- The Phase I ESA conducted for the Project found a low likelihood that off-site properties present a recognized environmental concern to future occupants of the site. Pending any further analysis that may be required, there are no off-site contaminated sites or sources within one-quarter mile of the Project that would emit hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste.
- The maximum noise levels generated at the Project's parking lot would be below the daytime threshold established by the City of Oakland Noise Ordinance. Parking lot noise generated during the evening hours would also be below the maximum allowable noise levels (in dBA Leq) established by the City of Oakland Noise Ordinance, which are 60 dBA L33 (or for 20 minutes) during a 1-hour period during the daytime between 7:00 a.m. and 10:00 p.m. This is a less than significant impact.
- The Project would have no impact related to exposure of people to wildfire risk for lands in or near state Responsibility Areas classified as Very High Fire Hazard severity zones. The Project

site, which is located within an urbanized area of the City of Oakland, is not identified as within, nor is it near a Very High Fire Hazard Severity Zone.

Based on these conclusions, the Project would not have environmental effects that would cause substantial adverse effects on human beings, either directly or indirectly.

CEQA Findings

On the basis of this evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

■ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because mitigation measures to reduce these impacts will be required of the project. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that, although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

_____ _____

Signature Date

Mitigation Measures

The CEQA Finding for the Project concludes that the Project will not have a significant effect on the environment because mitigation measures to reduce potential impacts of the Project will be required. Pursuant to CEQA Guidelines Section 15071 (e), the following is a list of all mitigation measures required of the Project to avoid potentially significant effects. These measures have been agreed to by the District (as both applicant and lead agency) and when implemented, would avoid or mitigate the effects of the Project to a point where no significant effects (as defined by CEQA) would occur.

Air Quality

Mitigation Measure Air-1, Basic Construction Mitigation:

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.
7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
8. Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

Mitigation Measure Air-2, Additional Construction Mitigation Measures:

1. All exposed surfaces shall be watered at a frequency adequate to maintain minimum soil moisture of 12 percent. Moisture content can be verified by lab samples or moisture probe.
2. All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
3. Windbreaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Windbreaks should have at maximum 50 percent air porosity.
4. Vegetative ground cover (e.g., fast-germinating native grass seed) shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
5. The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
6. All trucks and equipment, including their tires, shall be washed off prior to leaving the site.

7. Site accesses to a distance of 100 feet from the paved road shall be treated with a 6 to 12 inch compacted layer of wood chips, mulch, or gravel.
8. Sandbags or other erosion control measures shall be installed to prevent silt runoff to public roadways from sites with a slope greater than one percent.
9. Minimizing the idling time of diesel powered construction equipment to two minutes.
10. The project shall develop a plan demonstrating that the off-road equipment (more than 50 horsepower) to be used in the construction project (i.e., owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent NOX reduction and 45 percent PM reduction compared to the most recent ARB fleet average. Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.
11. Use low VOC (i.e., ROG) coatings beyond the local requirements (i.e., Regulation 8, Rule 3: Architectural Coatings).
12. Require that all construction equipment, diesel trucks, and generators be equipped with Best Available Control Technology for emission reductions of NOx and PM.
13. Requiring all contractors use equipment that meets CARB's most recent certification standard for off-road heavy-duty diesel engines.

Regulatory Requirement Air-3, Asbestos in Structures: The project applicant shall comply with all applicable laws and regulations regarding demolition and renovation of Asbestos Containing Materials (ACM). These include but are not limited to California Code of Regulations, Title 8; California Business and Professions Code, Division 3; California Health and Safety Code sections 25915-25919.7; and Bay Area Air Quality Management District, Regulation 11, Rule 2, as may be amended.

Mitigation Measure Air-4, Diesel Particulate Matter Controls: The District shall ensure that all off-road diesel equipment used during the construction period, and all haul trucks used for soil export and import for the Project, are equipped with the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type, as certified by CARB. Methods to comply with this standard include, but are not limited to, new clean diesel trucks (Tier 4 engines automatically meet this requirement), higher-tier diesel engine trucks with added Particulate Matter (PM) filters, hybrid trucks, alternative energy trucks, or other methods that achieve the applicable CARB emission standard. This equipment must be properly maintained and tuned in accordance with manufacturer specifications, and verified through an equipment inventory submittal and Certification Statement.

Regulatory Requirement Air-5, Emergency Generator – TBACT: The Project's proposed diesel-powered emergency generator will be subject to CARB's Stationary Diesel Airborne Toxics Control Measure (ATCM), and will require permits from the BAAQMD. As part of the BAAQMD permit requirements, the engine emissions will have to meet Best Available Control Technology for Toxics (TBACT).

Biological Resources

Mitigation Measure Biology-1: Protect Nesting Birds. During construction of the Project, the removal of any trees and demolition of the existing buildings shall occur between September 1 and January 31. Tree removal and building demolition should be avoided from February 1 to August 31, which is the typical migratory bird's nesting period in this part of California. If no vegetation removal or building demolition is proposed during the nesting period, then no surveys are required.

1. If tree removal must occur during the bird breeding season, all trees to be removed shall be surveyed by a qualified biologist to verify the presence or absence of nesting raptors or other birds. Pre-removal surveys shall be conducted within 15 days prior to the start of work.
2. If the survey indicates the potential presence of nesting raptors or other birds, the biologist shall determine an appropriately sized buffer around the nest in which no work will be allowed until the young have successfully fledged. The size of the nest buffer will be determined by the biologist in consultation with the California Department of Fish and Wildlife, and will be based largely on the nesting species and its sensitivity to disturbance. In general, buffer sizes of 200 feet for raptors and 50 feet for other birds should suffice to prevent disturbance to birds nesting in the urban environment, but these buffers may be increased or decreased, as appropriate, depending on the bird species and the level of disturbance anticipated near the nest.

Regulatory Requirement Biology-1, Compliance with Tree Protection Ordinance: The Project will be required to obtain a tree permit from the City of Oakland for the removal of four trees from the Project's frontage along Union Street, and to abide by the conditions of that permit. Standard conditions that apply to the City's tree permit include the following:

1. Adequate protection shall be provided during the construction period for any trees which are to remain standing, including the recommendations of an arborist.
2. Replacement tree plantings shall be required for tree removals for the purposes of erosion control, groundwater replenishment, visual screening, wildlife habitat, and preventing excessive loss of shade
3. No tree replacement shall be required for the removal of non-native species, for the removal of trees which is required for the benefit of remaining trees, or where insufficient planting area exists for a mature tree of the species being considered.

Cultural Resources

Mitigation Measure Cultural-1: Survey of the Project Area. An archaeologist should conduct a pedestrian archaeological survey of the Project area after building demolition and asphalt removal, and after soil excavation. Any newly discovered historic (over 45 years of age) or prehistoric archaeological sites identified during the survey must be recorded, as required, on appropriate Department of Parks and Recreation Primary Record (DPR 523) and associated (e.g., Building-Structure-Object) forms.

Mitigation Measure Cultural-2: Inadvertent Discoveries. If any previously unknown prehistoric resources are discovered during grading, trenching, or other on-site excavation(s), then earthwork within 25 feet of these materials shall be stopped until a qualified professional archaeologist has evaluated the potential significance of the find, and suggests appropriate steps to protect the resource.

1. According to CEQA Section 15126.4, avoidance is the preferred mitigation. Since CEQA provisions regarding the preservation of historic resources direct that adverse effects to historic resources shall be avoided, if feasible, the resource shall be protected from damaging effects through avoidance.
2. If avoidance of any previously undiscovered archaeological site is not feasible, data recovery shall be conducted in accordance with an approved Archaeological Data Recovery Plan (ADRP) to mitigate adverse effects to the significance of the site – the area of data recovery being limited to the area of adverse effect. This would fulfill CEQA requirements that the mitigation measure must be "roughly proportional" to the impacts of the project. A professional, qualified archaeologist shall conduct data recovery in compliance with CEQA Guideline Section §15064.5. Once the site has been properly tested, subject to data recovery, or preserved to the

satisfaction of the professional archaeologist in compliance with CEQA Guideline §15064.5, the site can be further developed.

Mitigation Measure Cultural-3: Inadvertent Discovery of Human Remains. Section 7050.5(b) of the California Health and Safety code will be implemented in the event that human remains, or possible human remains, are located during Project-related construction excavation. Section 7050.5(b) states, "In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code".

1. The County Coroner, upon recognizing the remains as being of Native American origin, is responsible to contact the NAHC within 24 hours. The NAHC has various powers and duties, including the appointment of a Most Likely Descendant (MLD) to the Project. The MLD, or in lieu of the MLD, the NAHC, has the responsibility to provide guidance as to the ultimate disposition of any Native American remains.

<u>Geologic Hazards</u>

Regulatory Requirement Geology-1, California Building Code: Because the Project site is located within a seismically active region, the building design and construction must consider the effects of seismic activity in accordance with the latest (2019) edition of the California Building Code (CBC).

The building design has already been reviewed by the California State Architect and the California Geological Survey, and those agencies have determined that the engineering geology and seismology issues at this site are adequately assessed with the mitigation measures listed below, and no further information is requested.

Mitigation Measure Geology-2, Seismic Design Parameters: According to the CEL Geology Study, the Project should be designed in accordance with local design practice to resist the lateral forces generated by ground shaking associated with a major earthquake occurring within the greater San Francisco Bay region. Based on the measured shear wave velocity at the site, CEL has estimated average shear wave velocity of 300 meter/second, and classified the site as Site Class "D". For design of the site structures in accordance with the seismic provisions of the CBC 2019 and American Society of Civil Engineers (ASCE) 7-16, the following design seismic ground motion values are recommended.

1. Mapped Spectral Response Accelerations: Short Period - 1.592 g, and 1-second Period - 0.6 g
2. Adjusted Maximum Spectral Response Accelerations: Short Period - 1.778 g, and 1-second Period - 1.650 g
3. Design Spectral Response Accelerations: Short Period - 1.185 g, and 1-second Period - 1.100 g
4. Site-Specific Peak Ground Acceleration (PGA): 0.700 g

Mitigation Measure Geology-3, Utility Penetrations at Building Perimeter: Flexible connections at building perimeters should be considered for utility lines going through perimeter foundations. This would provide flexibility during a seismic event. This could be provided by special flexible connections, pipe sleeving with appropriate waterproofing, or other methods.

Regulatory Requirement Geology-4, Notice of Intent: The project applicant shall submit a Notice of Intent (NOI) to comply with the requirements of the Construction General Permit issued by the State Water Resources Control Board (SWRCB)

Regulatory Requirement Geology-5, Stormwater Pollution Prevention Plan: Pursuant to the Construction General Permit, the project applicant shall prepare and implement during construction a Stormwater Pollution Prevention Plan (SWPPP), including Best Management Practices (BMPs) to reduce erosion, sedimentation and water quality impacts during construction to the maximum extent practicable.

Mitigation Measure Geology-6, Project Compaction Recommendations: The Project's grading plans should follow all recommended compaction requirements as presented in Table 6 of the CEL Geology Study.

Mitigation Measure Geology-7, Building Pad Grading. To reduce potential abrupt differential settlement of the near surface soils as well as to provide uniform bearing support, the buildings should be supported by a layer of reworked, engineered fill. The fill layer should extend to at least four feet below existing ground surface. It should be constructed by a combination of over-excavating the pad below the existing grade, scarifying the over-excavation subgrade to a depth of at least eight inches, and compacting the exposed surface to the project compaction requirements, and backfilling with compacted, engineered fill to the new building pad subgrades. Therefore, the scarified fill thickness can be considered part of the required minimum four-foot engineered fill thickness. The engineered fill layer should extend at least five feet horizontally beyond the perimeter of the building footprints or as feasible if limited by nearby structures.

1. Engineered fill should be placed and compacted to final pad subgrade in accordance with the detailed recommendations presented in the CEL Geology Study.
2. Due to the granular nature of the near-surface materials, excavating the edges of the over-excavations may require that slopes be cut back, as near-vertical slopes may not stand beyond the short-term.

Mitigation Measure Geology-7, Shallow Foundations: The proposed buildings can be supported on conventional continuous perimeter and interior spread footings bearing on the recommended engineered fill layer. Footings should have a minimum width of 18 inches and founded on a minimum of 24 inches below lowest adjacent finished grade (i.e., pad subgrade for interior continuous footings, exterior compacted surface grade for exterior footings, not including loose landscape or topsoil material).

Mitigation Measure Geology-8, Grading Flatwork/Pavement Areas: Areas to receive concrete hardscape or pavements should be scarified to a minimum depth of eight inches below existing grade or final subgrade, whichever is lower. Scarified areas should be moisture conditioned and compacted. Where required, engineered fill should be placed and compacted to reach design subgrade elevation. Rubber-tired heavy equipment, such as a full water truck, should be used to proof load exposed subgrade areas where pumping is suspected. Proof loading will determine if the subgrade soil is capable of supporting construction equipment without excessive pumping or rutting.

Mitigation Measure Geology-9, Interior Floor Slabs: Surficial onsite materials appears low to non-plastic; therefore, a non-expansive fill layer is not required for the proposed building. Slab reinforcing as well as slab construction joints should be designed by the structural engineer or slab designer to satisfy the anticipated use and loading of the slab. Slab-on-grade subgrade surfaces should be proof-rolled to provide a smooth, unyielding surface for slab support.

Mitigation Measure Geology-10, Positive Drainage: Final grading should be designed to provide drainage away from structures and the top of slopes.

1. Soil areas within 10 feet of proposed structures should slope at a minimum of 5% away from the buildings.
2. Adjacent concrete hardscape should slope a minimum 2% away from the buildings.
3. Roof leaders and downspouts should not discharge into landscape areas adjacent to buildings, and should discharge onto paved surfaces sloping away from the structures or into a closed pipe system channeled away from the structure to an approved collector or outfall.

Mitigation Measure Geology-11, Vapor Barrier: A vapor retarder or barrier should be placed directly under the slab. A sand layer is not required over the vapor retarder from a geotechnical standpoint. During construction, all penetrations (e.g., pipes and conduits,) overlap seams, and punctures should be completely sealed using a waterproof tape or mastic applied in accordance with the vapor retarder manufacturer's specifications. The vapor retarder or barrier should extend to the perimeter cutoff beam or footing.

Hazards and Hazardous Materials

Regulatory Requirement Hazards-1, Completion of the DTSC Environmental Review and Cleanup Process: Pursuant to Health and Safety Code requirements for projects under the regulatory review and oversight of DTCS's Brownfields Restoration and School Evaluation Branch, the Project must complete the DTSC-established protocols for site evaluation and cleanup. Pursuant to this process, remaining steps include, but are not limited to the following:

1. Approval and acceptance of a final Preliminary Environmental Assessment
2. Entering into a subsequent Voluntary Cleanup Agreement or School Cleanup Agreement
3. Preparation of a Removal Action Work Plan or Remedial Action Plan, including providing additional opportunities for public comment
4. Conducting all necessary cleanup activities pursuant to an approved Removal Action Work Plan or Remedial Action Plan
5. Obtaining a "No Further Action" letter from DTSC, once all cleanup activities are satisfactorily completed under DTSC oversight

Regulatory Requirement Hazards-2, Soil Management Plan: Pursuant to DTSC's review and approval of the Phase I and Phase II Removal Action Work Plans, these approvals will also require preparation and implementation of a Soil Management Plan (SMP). The SMP is to be implemented during future remediation excavation and construction activities to protect construction workers, site occupants and off-site receptors from potential exposure to lead and arsenic in the soil. The SMP will serve as the guidance document for evaluation of clean, contaminated and hazardous soils during soil disturbance activities. Sections of the SMP will include:

1. A program of participant roles and responsibilities, description of the physical setting, soil screening criteria, soil management objectives, remedial actions and notifications
2. Health and Safety plans, including a discussion of proper personal protective equipment (PPE) to mitigate direct contact exposure of contaminated soils to site workers
3. Delineation of exclusion work zones and hazard warning signage, best management practices (BMPs) for PPE and equipment decontamination, and site worker hygiene
4. Soil excavation and monitoring (including air monitoring of dust levels, and the requirement that all excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph (see Mitigation Measure Air-2)

5. Soil segregation, stockpiling soil and stockpile management, including proper storage of excavated soils to prevent cross contamination (e.g. stockpiling on plastic sheeting and covering), to prevent wind dispersal by requiring that stockpiled soil on-site be watered or treated with soil stabilizers, and covered (see Mitigation Measure Air-2), and to prevent inadvertent contamination from stormwater runoff (see Mitigation Measure Hydrology-2 pertaining to SWPPP requirements of the NPDES regulations)
6. Transport management, including the requirement that all trucks off-hauling soil maintain at least two feet of freeboard and employ covers (see Mitigation Measure Air-2)

Hydrology

Regulatory Requirement Hydrology-1, State Construction General Permit and SWPPP: The Project applicant shall file a Notice of Intent with the State Water Resources Control Board (SWRCB) for construction-period releases of stormwater to be covered under the State's Construction General Permit. Pursuant to the requirements of that at Permit, the Project sponsor shall prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) and other permit documents as may be required by the SWRCB. At a minimum, the SWPPP shall include:

1. Best Management Practices (BMPs) to minimize erosion and sediment (i.e. gravel bags, silt fence, straw wattle, sediment basin, soil stabilizers, etc.)
2. BMPs to minimize non-stormwater discharges (i.e. concrete waste management, material waste management, good housekeeping practices, etc.)
3. Site inspections and BMP maintenance

Regulatory Requirement Hydrology-3, Post-Construction Stormwater Management Plan: The Project shall be subject to compliance with the requirements of Provision c.3 of the Municipal Regional Stormwater Permit, including developing and implementing a Post-Construction Stormwater Management Plan (SWMP) subject to the review and approval of the City of Oakland (as the discharge permittee). The SWMP must identify the location and size of new and replaced impervious surfaces, the directional surface flow of stormwater runoff, and the location of proposed on-site storm drain lines, the site design measures to reduce the amount of impervious surface area, source control measures to limit stormwater pollution, and stormwater treatment measures to remove pollutants from stormwater runoff.

Noise

Mitigation Measure Noise-1, Construction Days/Hours: The Project's construction schedule should comply with the following restrictions concerning construction days and hours:

1. Construction activities should be limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday, except that extreme noise generating activities greater than 90 dBA and soil import and export operations shall be limited to between 8:00 a.m. and 4:00 p.m. Use of concrete saws shall be limited to the hours between 8:00 am and 4:00 pm on weekdays.
2. Construction activities should be limited to between 9:00 a.m. and 5:00 p.m. on Saturday, but only within the interior of the building with the doors and windows closed.
3. No construction is allowed on Sunday or federal holidays.
4. Any construction activity proposed outside of the above days and hours for special activities (potentially such as the longer-duration soil export and import operations) shall be evaluated on a case-by-case basis by the District, with criteria including the urgency/emergency nature of the work, the proximity of residential or other sensitive uses, and a consideration of nearby residents'/occupants' preferences. The District shall notify property owners and occupants

located within 300 feet at least 14 calendar days prior to construction activity proposed outside of the above days/hours.

Mitigation Measure Noise-2, Construction Noise Control Best Management Practices (BMPs): The District and the District's contractor should implement best management practices (BMPs) for noise reduction to reduce construction noise to the extent practical. Noise reduction BMPs include, but are not limited to the following

1. Equipment and trucks used for construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds), wherever feasible.
2. Impact tools (e.g., jackhammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used. These types of mufflers can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used if such jackets are commercially available, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures.
3. Use electrical power instead of generators, where feasible.
4. Locate stationary noise sources as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers or use other measures to provide equivalent noise reduction. Stage large equipment, compressors or generators at least 25 feet from the site perimeters when work is not being done near these uses.
5. The noisiest phases of construction should be limited to less than 10 days at a time. Exceptions may be allowed if the District determines an extension is necessary and all available noise reduction controls are implemented.
6. Construction activities should be conducted in a manner that minimizes the noise impact at the adjacent property boundaries wherever possible. Construction equipment shall be positioned as far from noise sensitive receptors as possible.
7. Prohibit unnecessary idling of internal combustion engines.
8. Erect temporary plywood noise barriers around the construction site during the loudest construction phases (ground clearing and excavation).

Mitigation Measure Noise-3: Noise Monitoring and Complaint Response: The District should establish and implement a set of procedures for responding to complaints received pertaining to construction noise, and implement these procedures during construction. These procedures should include:

1. Notify property owners and occupants located within 300 feet of construction activities at least 14 calendar days prior to commencement of construction.
2. Designate an on-site construction complaint and enforcement manager for the project.
3. Post a large on-site sign near the public right-of-way containing permitted construction days/hours, complaint procedures and phone numbers for the complaint manager.
4. Construction noise monitoring should be undertaken if reliable noise complaints are received during demolition, excavation and/or construction activities.

Transportation

Mitigation Measure Transportation-1, Traffic Control Plan: The District shall prepare and implement a Traffic Control Plan during the construction and soil remediation process. The Traffic Control Plan shall contain a set of comprehensive traffic control measures for auto, transit, bicycle and pedestrian accommodations (or detours, if accommodations are not feasible). These traffic control measures should include an overall construction logistics plan with designated construction access routes, construction worker parking plan and construction phasing plan, proposed truck routes, detour signage and lane closure procedures (if required), signs or cones for driver safety, and a pedestrian safety plan. The Traffic Control Plan shall be in conformance with the City of Oakland's Supplemental Design Guidance for Accommodating Pedestrians, Bicyclists and Bus Facilities in Construction Zones.

Utilities and Services

Mitigation Measure Utilities-1, Water Efficient Landscape: The District shall comply with California's Water Efficient Landscape Ordinance (WELO) in order to reduce landscape water usage, including compliance with a Project-specific calculation of the Project's Maximum Applied Water Allowance.

Mitigation Measure Utilities-2, Green Building Requirements: The District shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures for water conservation.

Mitigation Measure Utilities-3, Construction and Demolition Waste Reduction and Recycling: The District shall comply with the City of Oakland Construction and Demolition Waste Reduction and Recycling Ordinance (chapter 15.34 of the Oakland Municipal Code) by preparing and implementing a Construction and Demolition Waste Reduction and Recycling Plan. That Plan shall specify the methods by which the project will divert construction and demolition debris waste from landfill disposal.

Mitigation Measure Utilities-4, Recycling Collection and Storage Space: The District shall comply with the City of Oakland Recycling Space Allocation Ordinance (chapter 17.118 of the Oakland Planning Code). For non-residential projects, at least two (2) cubic feet of storage and collection space per 1,000 square feet of building floor area is required, with a minimum of ten (10) cubic feet.

Cole Admin Bldg with Remed

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Government Office Building	27.30	1000sqft	0.63	27,300.00	0
Junior College (2yr)	28.60	1000sqft	0.66	28,600.00	0
Parking Lot	93.00	Space	0.84	37,200.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	63
Climate Zone	5			**Operational Year**	2024
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use -

Construction Phase - Remediation I assumes 9,160 CY export, at 8 CY/haul = 1,145 haul trips, at 60 haul trips per day = 19 days
Grading I assumes 9,160 CY import, ay 8 CY/haul = 1,145 haul trips, at 60 haul trips per day = 19 days
Remediation II assumes 2,560 CY export, at 8 CY/haul = 300 haul trips, at 60 haul trips per day = 5 days
Grading II assumes 4,860 CY import, at 8CY/haul = 608 haul trips, at 60 haul trips per day = 10 days
Trips and VMT - haul length for export of contaminated soils is estimated at 200 miles to licensed facility

Demolition -

Grading - 2.6 acre site
1.6 ac in Phase I
1.0 ac in Phase II
Mobile Land Use Mitigation -

Area Mitigation -

Energy Mitigation -

Waste Mitigation -

I. INTRODUCTION

This Historic Resource Evaluation (HRE) has been prepared at the request of Lamphier-Gregory for the former Cole Middle School campus located at 1011 Union Street (APN 4-53-7) in West Oakland's Oak Center neighborhood. The generally rectangular parcel is roughly 112,820 square feet in area and is located at the northwest corner of 10th and Union streets.[1] This report evaluates two educational buildings situated within the property: a classroom building (Cole School) originally constructed in 1925 and renovated 1936; and a cafeteria building constructed in 1949. Each of these buildings shares the address 1011 Union Street. The report does not address the ancillary building at the northeast corner of the site, which was built in 2011. The campus was originally used as an elementary or grammar school and was converted to a middle school in 1980. The school closed in 2009, and the campus has since been used as an Oakland Unified School District (OUSD) administrative facility, with one of OUSD's two Data Centers occupying space in the former Cole School. The Cole School building has also housed the headquarters for the OUSD police unit since 2009. Since 2015, OUSD's Special Education Department has occupied five classrooms spread across the two subject buildings for students with special needs.

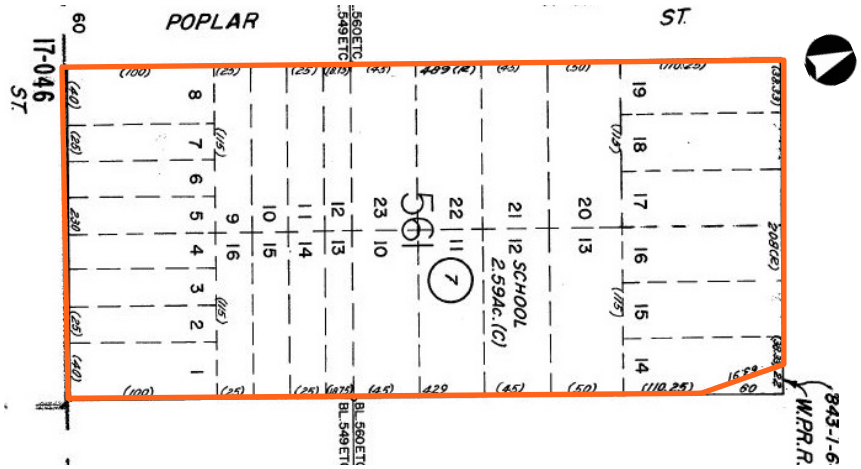

Figure 1: Assessor parcel map showing location of subject property (outlined in orange). Source: Alameda County Assessor's Office, Online. Edited by Page & Turnbull.

METHODOLOGY

Page & Turnbull prepared this report using research collected at various local repositories, including the Alameda County Office of the Clerk-Recorder, the City of Oakland Building Department and Oakland Public Library History Room, as well as various online sources including California Digital Newspaper Collection, Newspapers.com, and the David Rumsey Map Collection. Key primary sources consulted and cited in this report include Sanborn Map Company fire insurance maps, historic newspapers, building permit applications, city directories, and historic building plans provided to Page & Turnbull by OUSD. On October 29, 2019, Page & Turnbull visited the site with Lamphier-Gregory and completed architectural photography and field notes. All photographs in this report were taken by Page & Turnbull October 29, 2019, unless otherwise noted.

SUMMARY OF FINDINGS

This HRE finds that the Cole School classroom building and cafeteria at the Cole Middle School campus (1011 Union Street) **do not appear to qualify as eligible historic resources** for the purposes of review under the California Environmental Quality Act (CEQA).

[1] Area calculation provided at online at http://gisapps1.mapoakland.com/planmap/planmap.html?apn=004%20005300700. Accessed October 25, 2019.

II. EXISTING HISTORIC STATUS

The following section examines the national, state, and local historical ratings currently assigned to the property at 1011 Union Street.

NATIONAL REGISTER OF HISTORIC PLACES

The National Register of Historic Places (National Register) is the nation's most comprehensive inventory of historic resources. The National Register is administered by the National Park Service and includes buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state, or local level.

1011 Union Street is not currently listed in the National Register of Historic Places.

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

The California Register of Historical Resources (California Register) is an inventory of significant architectural, archaeological, and historical resources in the State of California. Resources can be listed in the California Register through several methods. State Historical Landmarks and National Register-listed properties are automatically listed in the California Register. Properties can also be nominated to the California Register by local governments, private organizations, or citizens. The evaluative criteria used by the California Register for determining eligibility are closely based on those developed by the National Park Service for the National Register of Historic Places.

1011 Union Street is not currently listed in the California Register of Historical Resources.

CALIFORNIA HISTORICAL RESOURCE STATUS CODE

Properties listed or under review by the State of California Office of Historic Preservation are assigned a California Historical Resource Status Code (Status Code) of "1" to "7" to establish their historical significance in relation to the National Register of Historic Places (National Register or NR) or California Register of Historical Resources (California Register or CR). Properties with a Status Code of "1" or "2" are either eligible for listing in the California Register or the National Register or are already listed in one or both registers. Properties assigned Status Codes of "3" or "4" appear to be eligible for listing in either register, but normally require more research to support this rating. Properties assigned a Status Code of "5" have typically been determined to be locally significant or to have contextual importance. Properties with a Status Code of "6" are not eligible for listing in either register. Finally, a Status Code of "7" means that the resource has not been evaluated for the National Register or the California Register, or needs reevaluation.

"Cole School" is listed in the California Historic Resources Information System (CHRIS) database with a Status Code of 6Z (Found ineligible for NR, CR or Local designation through survey evaluation). In the case of the subject property, its 6Z status relates to a survey and evaluation undertaken in 1990, which evaluated the building for eligibility to the National Register but did not address eligibility for the California Register. The most recent update to the CHRIS database for Alameda County that lists the Status Codes was in March 2011.

CITY OF OAKLAND HISTORIC PRESERVATION

City of Oakland Thresholds of Significance Guidelines[2]
Per the City of Oakland's Thresholds of Significance Guidelines, an historical resource under the California Environmental Quality Act (CEQA) is a resource that meets any of the following criteria:

> 1) A resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources;
> 2) A resource included in Oakland's Local Register of historical resources, unless the preponderance of evidence demonstrates that it is not historically or culturally significant;[3]
> 3) A resource identified as significant (e.g., rated 1-5) in a historical resource survey recorded on Department of Parks and Recreation Form 523, unless the preponderance of evidence demonstrates that it is not historically or culturally significant;
> 4) Meets the criteria for listing on the California Register of Historical Resources; or
> 5) A resource that is determined by the Oakland City Council to be historically or culturally significant even though it does not meet the other four criteria listed above.

Oakland Cultural Heritage Survey
The Oakland Cultural Heritage Survey (OCHS), established in 1981, evaluates individual properties according to a five-tiered alphanumeric system. The alphabetical portion, the Individual Property Rating, is based on evaluation of a property according to the following four criteria:

- Visual Quality/Design: Evaluation of exterior design, interior design, materials and construction, style or type, supporting elements, feelings of association, and importance of designer.
- History/Association: Association of person or organization, the importance of any event, association with patterns of history, and the age of the building.
- Context: Continuity and familiarity of the building within the city, neighborhood, or district.
- Integrity and Reversibility: Evaluation of the building's condition, its exterior and interior alterations, and any structural removals.

Evaluated properties are assigned an Individual Property Rating corresponding to their ability to meet these criteria as follows:

A. Highest importance (Outstanding architectural example or of extreme historical importance);
B. Major importance (Fine architectural example or of major historical importance);
C. Secondary importance (Superior or visually important architectural example, or very early);
D. Minor importance (Representative architectural example);
E. Of no particular interest; and
F. Less than 45 years old or modernized.

A building's rating in its existing condition is expressed as a capital letter. Contingency ratings, expressed after the rating as a lower-case letter, indicate a potential rating under certain conditions. Contingency ratings may be applied to buildings whose rating would change with restoration or increased age, or for which additional information is needed.

---

[2] City of Oakland, CEQA Thresholds of Significance Guidelines, October 28, 2013. Website accessed January 2019 from: http://www2.oaklandnet.com/oakca1/groups/ceda/documents/report/oak051200.pdf.
[3] The City of Oakland's Local Register includes all designated historic properties (Landmarks, Heritage Properties, Study List Properties, Preservation Districts, and S-7 and S-20 Preservation Combining Zone Properties) as well as all Potential Designated Historic Properties that have an existing rating of "A" or "B" or are located within an Area of Primary Importance.

A property's relationship to an Area of Primary or Secondary Importance is expressed as part of its rating in numeric form as follows:

1. Located in an Area of Primary Importance, or National Register quality district;
2. Located in an Area of Secondary Importance, or district of local interest; and
3. Not located in a historic district.

Properties that are contributors to a district are assigned a "+", non-contributors a "-", and potential contributors are assigned a "*" as part of their numeric rating. Many of the preliminary ratings assigned as part of the Oakland Cultural Heritage Survey through the 1980s were based on reconnaissance level survey. These initial findings may be updated based on additional information about historic context and property integrity found through intensive surveys.

Designated Historic Properties
City of Oakland Historic Landmarks are the most prominent historic properties in the city. They may be designated for historical, cultural, educational, architectural, aesthetic, or environmental value. They are nominated by their owners, the City, or the public and are designated after public hearings by the Landmarks Board, Planning Commission, and City Council. This category also includes preservation districts and Heritage Properties. Since the program began in 1973, 145 individual landmarks, 9 preservation districts (designated S-7 or S-20 Preservation Zones), and 45 Heritage Properties have been designated, out of nearly 100,000 buildings in Oakland. Proposed alterations and demolitions that would affect landmarks and preservation districts require review by the Landmarks Preservation Advisory Board.

Potential Designated Historic Properties
Any property that has at least a contingency rating of "c" and/or is a contributor (+) or potential contributor (*) to a historic district but is not yet individually designated is considered a Potential Designated Historic Property (PDHP).

Local Register of Historic Resources
The Oakland City Council enacted the Historic Preservation Element (HPE) in 1994.[4] The HPE presents goals, policies, and objectives that guide historic preservation efforts in Oakland. It defines the criteria for legal significance that must be met by a resource before it is listed in Oakland's local register of historical resources and would therefore be considered a historical resource under CEQA. According to the HPE, for purposes of environmental review under the California Environmental Quality Act, the following properties will constitute the City of Oakland's Local Register of Historical Resources (Local Register).

1) All Designated Historic Properties (including Oakland Landmarks, S-7 and S-20 Preservation Districts, and Preservation Study List properties), and
2) Those PDHPs that have an existing rating of "A" or "B" or are located within an Area of Primary Importance.

City of Oakland Historic Preservation Status of 1011 Union Street

1011 Union Street was preliminarily documented by the Oakland Cultural Heritage Survey in 1990 and has been assigned an OCHS rating of "C3," indicating the property is of secondary importance (representative architecture example) and is not located within a historic district. 1011 Union Street is not a City of Oakland Landmark and is not currently listed in the Local Register.

[4] City of Oakland. 1994. Historic Preservation Element of the Oakland General Plan. Adopted March 8, 1994. Website accessed January 2019 at: http://www2.oaklandnet.com/Government/o/PBN/OurServices/GeneralPlan/DOWD009018

III. ARCHITECTURAL DESCRIPTION

The subject site is generally rectangular in shape, with a clipped northeast corner, due to a rail right-of-way. The Cole School classroom building is situated at the south end of the site, with its primary façade fronting Union Street (east), and secondary facades fronting 10th Street (south) and Poplar Street (west). The Cafeteria building is situated northwest of the Cole Schools' west wing, with its west façade fronting Poplar Street and is south façade facing the rear of the Cole School. A wood-frame modular building built in 2011 is located at the far northeast corner of the site. The remainder of the property is paved with asphalt. Parking areas and a playground occupy the northern end of the site **(Figure 2)**.

Figure 2: Aerial view of the subject property. The subject parcel is outlined in orange. A red dashed line indicates the perimeter of the OUSD police unit's parking lot within the property. Source: Alameda County Assessor Online. Edited by Page & Turnbull.

COLE SCHOOL BUILDING

The Cole School is a two-story, U-plan building of reinforced-concrete and wood-frame construction. The school was built in 1925 and designed in the Gothic Revival style, but was renovated and restyled in 1936, resulting in its current Moderne aesthetic. The building has a smooth cement plaster exterior and a flat roof with a parapet at all façades. A sheet metal beltcourse divides the first and second story, serving as a sill beneath most of the second story windows. The cornice is formed from a sheet metal fascia that is continuous across all facades. Fenestration consists primarily of banks of five aluminum-frame, one-over-one, single-hung replacement windows with individual transoms above; these windows will be referred to throughout this report as "standard windows." Most windows at the first story have metal security screens at the exterior **(Figure 3 and Figure 4)**. Second story windows above first story entrances (where bays are narrower) are typically of similar design but in a paired configuration. All doors at the exterior appear to be replacement flush doors of either wood or steel.

Figure 3: Typical first story windows with security screens.

Figure 4: Typical second story windows without security screens.

Exterior detailing includes overlapping concrete vertical elements with rounded edges and metal capitals that flank the main at the main entrance at the east façade and two entrances at the south facade **(Figure 5)**. The main entrance also features a curved canopy with a streamlined sheet metal fascia and vertical corrugated metal directly flanking the main doors. Concave stripes are visible at concrete walls adjacent to the main entrance. The side entrances at the west façade feature similar portals that feature a monumental stucco surround with fluted keystones and a scalloped frieze **(Figure 6)**. Doors are flush metal or flush wood, with minimal to no glazing. At the rear facade, fluted engaged concrete columns extend from ground level to the second story, dividing each auditorium window.

Figure 5: Scalloped capital details, visible at columns flanking main entrance, looking west.

Figure 6: Fluted keystone and scalloped details above each entrance at south facade.

Primary (East) Façade (Union Street)

The Cole School's primary façade is visible at the east wing of the school's U-plan, parallel to Union Street, and is set back from the street roughly 15 feet **(Figure 7)**. The façade has five bays, with two bays on either side of the central main entrance bay. The southernmost bay features similar banks of five standard windows at the first and second story. A fence enclosure surrounding HVAC equipment is visible at the base of the first story. The second to southernmost bay contains paired windows at the first and second stories; those at the first story being slightly narrower overall **(Figure 8)**. The building's main entrance is visible just south of mid-façade and has flush metal doors; each with a single, narrow rectangular lite **(Figure 9)**. The entrance is flanked on each side by four overlapping, engaged concrete columns that have decorative metal capitals with scalloped detailing. Letters reading "COLE SCHOOL" mounted to the façade above the canopy **(Figure 9)**.

Figure 7: Cole School, looking northwest from Union Street.

Figure 8: Two southernmost bays at the primary façade, looking west.

Figure 9: Primary entrance, looking west.

A fixed divided lite transom window with steel sash is visible above the main entrance doors. A curved canopy is visible above the transom and spans the width of the main entrance **(Figure 10)**. The central bay at the second story features a tripartite window **(Figure 11)**.

Figure 10: Divided-lite steel-frame window above main entrance, and curved entrance canopy, looking west.

Figure 11: Tripartite window at second story above main entrance, looking west.

To the north of the main entrance, the façade features a blank wall with streamline groove details at the first story **(Figure 12)**. A sill with molded sheet metal fascia extends northward from the entrance as a continuation of the curved entrance canopy, terminating after the second to northernmost bay. Above, the second story has a single standard window **(Figure 13)**. To the north, the first and second story each feature two bays of similar width containing banks of standard windows. The first story bays feature four windows with a single door inserted where a fifth window would typically be located **(Figure 15)**. The second story bays each contain five standard windows. Each of the doors are accessed by concrete steps with a wide landing and flat metal railing with a curved stair rail, that ties into the building's Moderne styling **(Figure 15)**.

Figure 12: Three westernmost bays at the primary façade, looking northwest.

Figure 13: Molded sheet metal fascia extending northward from the main entrance above the second to northernmost bay of the primary façade.

Figure 14: Secondary entrance within a bank of three windows at northernmost bay of primary façade, looking southeast.

Figure 15: Concrete steps and landing with metal railing at the north end of the primary façade, looking northwest.

South Façade (10th Street)

The south façade fronts 10th street and is set back from the street roughly 15 feet. The façade has five bays, including: two outer bays containing entrances at the first story and paired standard windows at the second story; and three central bays, each with a bank of five standard windows at the first and second story **(Figure 16)**. Each entrance is similar, with a set of flush metal double doors placed beneath a divided lite steel-sash transom. The entrances are recessed into a concrete surround with overlapping engaged columns at each side and a monumental flat surround. Keystones have fluting and the cornice of the entrance surround has metal scalloped detailing. Each entrance is accessed by two concrete steps with a landing **(Figure 17 and Figure 18)**.

Figure 16: South façade, view southwest.

Figure 17: East entrance at south façade, looking north.

Figure 18: West entrance at south façade, looking north.

West Façade (Poplar Street)

The west façade fronts Poplar Street and is set back from the street roughly 15 feet. The façade has four bays at each story, each containing a bank of five standard windows **(Figure 19)**.

Figure 19: Looking northeast at west façade.

Rear (North) Façade (Site Interior)

The rear façade overlooks parking areas within the property, and is deeply recessed between the east and west wings of the u-shaped plan. A two-story staircase and elevator shaft that was added to the building in 1973 is visible at the north façade of the east wing **(Figure 20)**. The staircase has a steel frame and steel railing and handrails. Steps are concrete set in steel beds **(Figure 21)**. Landings are visible at the first and second stories. The first-story bay to the east of the staircase contains two single standard windows. A first story entrance located beneath the staircase contains a wood-frame entrance with a central column dividing two flush wood replacement doors. Each door has a transom above that appears to be infilled with a painted panel. A remnant of a circular concrete detail within the entrance surround is visible just beneath the staircase landing above **(Figure 22)**. An additional entrance at the second story contains a similar replacement door **(Figure 23)**. The remainder of the north façade at the east wing is not fenestrated.

Figure 20: View of northeast wing at rear façade, looking southeast.

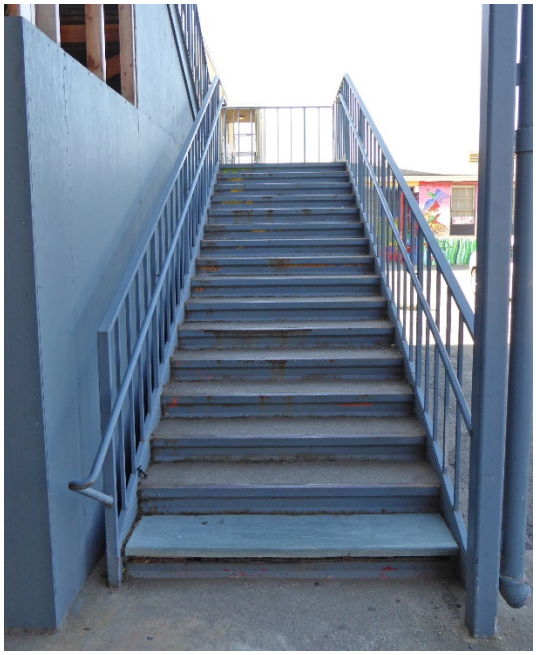

Figure 21: Looking west at steel-frame staircase at rear of the east wing.

Figure 22: Looking south at entrance at rear of east wing. Note concrete detail where staircase is attached to façade.

The west façade of the east wing features two bays with typical standard windows at each story. Entrances with single-entry flush doors and concrete steps are located within the two bays at the first story. The recessed central portion of the north façade features an entrance with flush double doors at the east side of the first story **(Figure 24)**. A similar entrance is located at the opposite, west side of the first story. The second story is fenestrated with five bays containing similar steel-frame windows with a grid of nine divided lites. Four pilasters with fluted details and no capitals are placed between each bay. The windows at the second story light the gymnasium/auditorium at the interior and are set at a height slightly below that of the second story windows visible at other locations **(Figure 25)**. The east façade of the west wing features similar fenestration to the west façade at the east wing, however, a single-entry door is set in the southernmost bay **(Figure 26)**.

Figure 23: Detail of staircase and second story landing, looking southeast.

Figure 24: Entrances and windows at rear façade.

Figure 25: Center, recessed portion of rear façade at auditorium/gymnasium, looking south.

Figure 26: East-facing windows along northwest wing of the rear façade, looking south.

An entrance with flush steel double doors is located at the first story of the west wing's north façade. A linear staircase extends from grade to the second story where an additional entrance is located. The staircase was built in 1973 and shares similar materials with the staircase located at the north façade of the east wing **(Figure 27 and Figure 28)**.

Figure 27: Looking southwest at first story entrance with double doors at rear facade, west wing.

Figure 28: Linear staircase at rear façade of the west wing, looking west.

CAFETERIA BUILDING

The Cafeteria Building was built in 1949 and is situated immediately north of the west wing of the Cole School building. The building has a rectangular footprint and a moderately pitched gabled roof with a projecting monitor near center. The roof is covered with asphalt shingles and has a molded wood cornice. The building features a cohesive fenestration pattern that reflects the division of classrooms and cafeteria spaces at the interior. The building is fenestrated with six-over-six, wood-sash, double-hung windows (referred to as "standard sash windows," hereafter) at most locations. These windows are primarily arranged in groups of four along the east and west façades. Additional standard sash windows are visible at the northwest corner of the building. Entrances are located at the center of the north and south façades and at the recessed southeast and northwest corners. Original doors are flush wood with four divided lites in the upper half (referred to as "original doors," hereafter). The southeast and northwest corners of the building are recessed, forming covered entries beneath the overhanging roof eaves **(Figure 29 and Figure 30)**.

Figure 29: Cafeteria Building viewed from second story of Cole School, looking northwest.

East and North Facades

The recessed southeast corner of the building contains an entrance with an original door set beneath a four-lite transom window. Three standard sash windows are visible immediately south of the door. The three northernmost bays in the façade contains groups of four standard sash windows. The north façade has a grouping of three standard sash windows divided by wood mullions at its east bay **(Figure 31)**. The central bay features a monumental entrance with a stucco surround, circular medallion and sheet metal cornice trim. The door at this location has been replaced by a contemporary flush steel door with a single rectangular lite. An original door surround of glass block, visible on original plans for the cafeteria, has been replaced by a plastered surround **(Figure 32)**. Paired standard sash windows and a single smaller wood window are visible to the west of the entrance **(Figure 33)**.

Figure 30: Recessed entrance at southeast corner, looking northwest.

Figure 31: Three standard sash windows divided my wood mullions at the north façade, looking southeast.

Figure 32: Entrance at center of north façade, looking southeast.

Figure 33: Paired and a smaller single wood-sash window at the west side of the north façade, looking south.

West and South Façades

At the northeast corner of the building the west façade is recessed. A flush wood door is set beneath a six-lite, wood transom window and is flanked by standard sash windows **(Figure 34)**. The remainder of the façade is divided into three similar bays with four standard sash windows each **(Figure 35)**. The south façade has a recessed entrance bay at center. The entrance has two similar original doors that are divided by a wood column. A single steel-sash window with four lites is located to the immediate east of the doors **(Figure 36)**.

Figure 34: Recessed northwest corner of building, looking east.

Figure 35: West façade, looking north.

Figure 36: Looking northwest at recessed entrance at south façade featuring two flush- wood doors with four divided lites each.

SITE FEATURES

The generally rectangular subject site is planted with grass to the southeast, south, and west of the Cole School building. A wood flagpole is set at the southeast corner of the site **(Figure 37)**. A fenced enclosure surrounds HVAC equipment at the southeast corner of the Cole School **(Figure 38)**. Beginning at the main entrance of the Cole School, the east perimeter of the site is paved with concrete, which extends to the parking lot area to the rear of the school that is paved with asphalt. Concrete steps with metal railings access the Cole School's main entrance **(Figure 39)**. To the north, several raised planting beds and movable planters occupy the portion of the site immediately east of the Cole School, south of the parking area **(Figure 40)**. The majority of the interior of the site to the north of the Cole School and the north/northeast of the Cafeteria building is paved with asphalt. Parking lots for OUSD and OUSD's Police Unit are divided by a chain-link fence **(Figure 41)**.

Figure 37: Wood flagpole at northwest corner of 10th and Union Streets (the far southeast corner of the site), looking east.

Figure 38: HVAC equipment enclosure at south end of primary façade, looking west.

Figure 39: Concrete steps and landing with metal railings at main entrance, looking northwest.

Figure 40: Wood fence at northwest property boundary, view northwest.

Figure 41: View of rear section of property and parking lots, looking north.

The area surrounded on three sides by the rear façade of the Cole School contains an outdoor storage area for various equipment such as filing cabinets, enclosed by a chain-link fence **(Figure 42)**. Additional raised planting beds are located to the immediate west of the Cafeteria Building **(Figure 43)**. A security gate is located along the west perimeter of the site and accesses a pathway located between the Cafeteria building and the west wing of the Cole School **(Figure 44)**. The area north of the Cafeteria building is paved with asphalt and leads to a basketball court. The north perimeter of the site is enclosed by chain-link fencing **(Figure 45)**.

Figure 42: Fenced equipment storage area to immediate north of rear façade, looking southwest.

Figure 43: Raised planting beds located between Cafeteria building's west façade and the west perimeter of the property, looking north.

Figure 44: Security fence with gate along west perimeter of property, looking east.

Figure 45: View looking north at north perimeter of the site from basketball court.

Several flat roof shade structures are visible at the rear of the, immediately south of the north perimeter fence **(Figure 46)**. An ancillary building constructed at the site in 2011 is visible at the northeast corner of the property. This building is not age-eligible for historic evaluation **(Figure 47)**.

Figure 46: Structures at rear of site near north perimeter, looking east.

Figure 47: Ancillary building at northeast corner of site, built in 2011.

SURROUNDING NEIGHBORHOOD

The subject property is situated at the southwest edge of Oakland's Oak Center neighborhood, where the Acorn neighborhood to the southeast, and the Prescott neighborhood to the west merge at 10th street **(Figure 48)**. The surrounding area is primarily residential, with a cluster of late 19th and early 20th century houses located on the five blocks between Union Street (west) and Filbert Street (east), between 10th and 12th streets. Residences designed in the Queen Anne, First Bay Tradition, and Neoclassical styles are visible along block faces joining at the northeast corner of 10th and Union streets, to the immediate east of the subject property. Most of the residences in this area predate the original construction of the subject building in 1925 and the façade reconstruction of the subject building in 1936 **(Figure 49 to Figure 53)**. Residences of more recent origin in the Acorn neighborhood are located to the south along Union Street and are vernacular in style **(Figure 52 and Figure 53)**. To the west and southwest, Peralta Villa Public Housing Community occupies blocks between Union Street (east) and Mandela Parkway (west) between 8th and 12th streets. This community was constructed during World War II **(Figure 54)**. An office building occupied by Oakland Housing Authority is located opposite 10th street, south of the subject property **(Figure 55)**. A public park with a playground is located immediately north of the subject property. An industrial facility operated by California Cereal Products is located to the north of the park **(Figure 56)**.

IV. HISTORIC CONTEXT

The following historic context focuses primarily on the West Oakland area within the City of Oakland and includes context specific to the vicinity of Oak Center neighborhood and subject property, which is located near the center of southern half of West Oakland **(Figure 57)**. This context is expanded upon in the Site Development History section of this report.

Figure 57: Map of West Oakland Planning Area. An orange arrow points to the subject property located within the Oak Center neighborhood, along its border with the Acorn (southeast) and Prescott (west/southwest) neighborhoods. Source: West Oakland Specific Plan, Draft EIR, prepared by JRDV Intl. Edited by Page & Turnbull.

EARLY OAKLAND

Native Americans known as the Ohlone were the first inhabitants of the Oakland area, with known settlements along the banks of Temescal creek dating from the 16th century. [5] The earliest documented European contact in the area occurred in 1772, when a Spanish expedition heading north from Monterey passed through.[6] Thereafter, the Spanish virtually ignored the East Bay region until 1820, when the government granted a large tract of land to Luis Maria Peralta upon his retirement from the Spanish military.[7] Peralta's grant extended from the shore of the bay to the crest of the Oakland hills, and from San Leandro Creek to "El Cerrito," or the little hill (most likely Albany Hill). The grant included the area that became Oakland, which was then known as Encinal (meaning Oak Grove in Spanish). It also included the future cities of Piedmont, Berkeley, Emeryville, Alameda, Albany, and part of San Leandro.[8] Peralta used the land as a cattle ranch, which he sub-divided and bequeathed to his four sons in 1842.[9] Most of what is now East Oakland was given to Antonio Peralta, and most of what is now North and West Oakland was given to Vicente Peralta.[10]

The 1849 Gold Rush that dramatically influenced San Francisco's development also brought fortune-seekers to Oakland.[11] Miners, lumbermen, businessmen, bankers, speculators, and opportunists settled across the bay in what was then known as Contra Costa, or "the other coast."[12] In 1850, three East Coast men arrived in Contra Costa: Horace W. Carpentier, Edson Adams, and Andrew J. Moon.[13] Each man leased 160 acres of land from Vicente Peralta and opened the area to squatters.[14] Swiss engineer Julius Kellersberger was hired to plat the land in a grid pattern starting at the shoreline. The lots were then sold, even though Carpentier, Adams, and Moon had no legal claim to the land.[15] Two years later, on March 25, 1852, the town of Oakland was incorporated.[16] Named for an oak grove that stretched from Lake Merritt to the bay, the city encompassed the present-day downtown area and West Oakland to 22nd Street.[17] The town's citizens, who numbered less than 100, elected Carpentier as the city's first mayor.[18] Oakland's first public school was established in 1853 at Clay and 5th streets.[19]

Oakland saw rapid growth and improvement after transportation connections were established with other communities.[20] Ferry service to San Francisco began in 1854, and the small settlements of San Antonio and Clinton east of Lake Merritt were connected with Oakland by a bridge built in 1856. Commercial and industrial businesses were established near the wharves, and the Central Pacific Railroad ran through downtown Oakland by 1863.[21] In 1868, Oakland was chosen as the western terminus for the Transcontinental Railroad. Beginning in 1869, the train brought tourists and workers to California and made Oakland a major port city and manufacturing center.[22] West Oakland became a shipping hub for western U.S. factories and a processing and manufacturing center for raw commodities such as agricultural products and lumber.

GROWTH OF WEST OAKLAND

As Oakland became an increasingly popular industrial core, residential and commercial neighborhoods expanded within the city limits. In 1873, Oakland became the county seat of Alameda County.[23] By 1880, the city's population rose to 34,555, more than 20 times what it had been in 1860.[24] Many of the new residents were San Francisco commuters drawn by Oakland's relatively low density and the ferry service across the bay. A large demographic consisted of railroad workers, many of whom were African American.[25] Oakland Point, which included a ferry stop, was connected with central Oakland by the local rail line along 7th Street, with stations at Wood, Center, Adeline, and Market Streets. The entire length of west 7th Street became a major commercial, lodging, and entertainment center which survives today only in fragments (the Arcadia Hotel, the Lincoln Theater, the Brotherhood of Sleeping Car Headquarters, Esther's Orbit Room). The subject property was developed as part of this period of population growth, with the first Cole Grammar School building completed by 1880.

Regarding West Oakland's pattern of early settlement and demographics leading into the 20th century, the West Oakland Specific Plan describes:

> The railroad yards and local parish church at [Oakland] Point began with a reputation as an Irish enclave, but there were strong Scandinavian, German, and African-American presences from the beginning. From around the turn of the century large numbers of Italian, Portuguese, and Eastern European residents appeared in the neighborhood, many of them recent immigrants or San Francisco earthquake refugees, at first living together in groups of lodgers while working as laborers. By the late 1910s and 1920s many of these new immigrants had become property owners in the district, and increasingly had occupations like factory worker, driver, and a whole range of food-related jobs, reflecting the increasing amount and diversity of industry in West Oakland and in Oakland as a whole.[26]

Promotional materials advertised Oakland's "world-renowned" climate, the prosperity of its citizens, its paved streets, and extensive streetcar lines.[27] It was home to several colleges, including the College of California (the precursor of the University of California, Berkeley), Mills Seminary (later Mills College), and St. Mary's College, located at 30th and Broadway. By 1895, the city hosted four daily newspapers, 50 churches, 14 schools (including the first Cole Grammar School, housed in a wood-frame building at the subject property ca. 1880-1923), four theaters or opera houses, and a public library. The health of the city was served at this time by a variety of personal physicians, small benevolent institutions and medical associations, and one hospital.[28]

Oakland expanded by annexing existing settlements and developing new districts.[29] Clinton, San Antonio, and the small town of Lynn (or Brooklyn) were annexed in 1872, pushing Oakland's eastern city limits out to 36th Street.[30] The small Temescal community, located in north Oakland, expanded in the 1860s with the installation of a telegraph line down present-day Telegraph Avenue and the establishment of a streetcar line to the University of California, Berkeley. Klinknerville, later Golden Gate, developed around Stanford and San Pablo avenues in North Oakland. Recreational facilities

like the Tubbs Hotel and Idora Park spurred expansion into areas such as East Oakland and North Oakland. Neighborhoods north of Lake Merritt were annexed in 1891, and Temescal, Golden Gate, and other north Oakland neighborhoods were annexed in 1897.[31] By 1900, Oakland's population numbered almost 67,000.

POST-EARTHQUAKE EXPANSION

The 1906 earthquake and fires displaced thousands of San Francisco residents to the East Bay for temporary and permanent housing. As described by author Robert Douglass, "The 1906 Earthquake left West Oakland virtually unscathed. By sparing the community, however, the quake affected it nonetheless…Many San Francisco businesses that had been wiped out by the quake and fire relocated to West Oakland or elsewhere in the East Bay."[32] Accordingly, West Oakland's demography showed a decrease in single-family households and an increase in the number of lodgers. Industries that West Oakland received included milling, canning, iron works, and light-manufacturing.[33]

On the whole, Oakland continued to grow geographically, increasing to nearly its present size by 1909, with the annexation of the hills area, Fruitvale, Melrose, Elmhurst, and the area south to San Leandro.[34] With those additions, the city's area nearly tripled to 60 square miles. Meanwhile, private developers saw an opportunity to plan communities for both the affluent and working classes in the North Oakland, West Oakland, and East Oakland neighborhoods, and parts of these areas became thoroughly family-friendly residential enclaves, including a cluster of turn of the 20th century residential properties on blocks east of Cole School property.

In 1910, the City of Oakland assumed control of its waterfront, which previously was held by private entities. The change of ownership prompted the expansion of the Port of Oakland.[35] As described in the West Oakland Specific Plan:

> The construction of the Shredded Wheat plant [(currently California Cereal Products)] at 14th and Union [streets, one block north of the subject property,] in 1915 was said to mark the end of today's Oak Center-Ralph Bunche neighborhood as a desirable residence district, and those who could afford it and found the changes in the old neighborhoods objectionable were beginning to move to the new tracts of bungalows and larger houses which developed in the lower hills in the building boom that followed the 1906 earthquake.[36]

WARTIME REDEVELOPMENT AND POST-WAR GROWTH

During World War I, Oakland's shipyards provided a "fleet of steel and concrete ships that…within the short space of a year put the Oakland estuary in the national limelight."[37] Development slowed during the Great Depression, but Oakland grew into a major shipbuilding center in the decade prior to World War II.[38] Beginning in 1936, the City of Oakland and Works Progress Administration (WPA) undertook studies related to the siting of a federal public housing project in Oakland. Two West Oakland sites including Peralta Villa, immediately west and southwest of the subject property, and Campbell Village at Oakland Point, were selected for redevelopment. Plans to redevelopment each neighborhood were met with protest from citizens that believed they resided in healthy neighborhoods of owner-occupied housing, while authorities were suspected of targeting African-American residents for removal. The public housing projects were completed at the dawn of World War II and converted to defense worker housing. Through labor recruitment efforts of both white and black workers from the South, Oakland's population grew, with the city's African-American population growing more than five-fold during the war years, with many newcomers settling in West Oakland.

> In the mid-1950s industrially zoned, largely minority West Oakland was cut in half by a major public works project, the Cypress Freeway. In the following decades, several more housing projects were built in West Oakland: the Acorn and neighboring projects south of Oak Center, Westwood Gardens in Prescott, and Chestnut Court in McClymonds.

Transportation systems played a major role in the development of West Oakland. The Bay Bridge, which opened in 1936, eased the commute between Oakland and San Francisco and likely attracted more residents to Oakland. In 1945, the city's population was 405,301. Transportation also directly impacted Oakland's physical development. The postwar emphasis on the automobile resulted in a high concentration of automobile dealerships, garages, and other automobile-related businesses established along the Broadway corridor between Grand Avenue and what is now I-580.[39] In the mid-1950s West Oakland, a largely-minority neighborhood with much industrial zoning, was divided by a major public works project, the Cypress Freeway.[40] The rise of the automobile also led to increased development in the suburbs and new freeways to reach these outlying areas.[41] As described by Douglass:

> As the system of freeways grew around the Bay Area and the rest of the nation, the original Cypress Freeway was designed as an efficient connector between the Bay Bridge and the Nimitz Freeway. It was completed in 1957, resulting in demolition of buildings [along Cypress Street, roughly two blocks west of the subject property,] physically dividing West Oakland. At the same time, as the de facto western limit of area "slum clearance," it acted to partially protect the neighborhoods between it and the bay.[42]

While freeway construction and redevelopment enticed some businesses and residents away from the city center, in many cases businesses and residents were forced into relocation as historic commercial and residential fabric in downtown and West Oakland disappeared. Increased economic and racial segregation were byproducts of this freeway and redevelopment orientation, and through the 1960s and 1970s Oakland experienced infrastructure decline associated with entrenched poverty, deindustrialization, and a weak urban tax base.[43]

In 1965, the Oak Center Urban Renewal Plan prepared by the Redevelopment Agency of the City of Oakland was adopted by the Oakland City Council.[44] This neighborhood redevelopment plan, combined with urban renewal in the neighboring Acorn redevelopment area to the southeast, brought extensive change to the immediate vicinity of the subject property during the late 1960s and 1970s. The subject property was within the Oak Center plan area, which spanned an approximately 500-acre section of West Oakland between 10th and 18th streets, bound by Brush Street to the east and Cypress Street (now Mandela Parkway) to the west. As of 1965, the project was reported to be the largest rehabilitation project ever attempted in the Western United States.[45]

Between 1969 and 1972 the new main Post Office and West Oakland BART Station heavily impacted West Oakland's 7th Street commercial strip and the entire Gibbons Tract west of South Prescott. A tight real estate market in San Francisco in the early 1980s sparked new development and preservation projects in Oakland, especially downtown.[46] Homebuyers began seriously considering Oakland neighborhoods, many of which retained strong local character.[47] In 1989 the Loma Prieta earthquake damaged many of the area's historic buildings, brought down the Cypress Freeway, and prompted a new look at West Oakland.[48] The city's population has remained steady throughout the 1990s and 2000s and was recorded as 425,195 in 2017.[49]

V. PROJECT SITE HISTORY

The existing Cole School stands on a site that was acquired by the City of Oakland's Board of Education (Board of Education) in 1875, and which appears to have been a vacant parcel prior to 1878 **(Figure 58)**.[50] Between 1877 and 1880, the original Cole Grammar School Building was built at the site, based upon research of city directories for Oakland that began listing the school in 1880 and one secondary source that provides the 1877 date of construction.[51] The original school was a two-story, Gothic Revival style building with a hipped roof and tall narrow windows, based upon a rendering published in 1885. The school was named in honor of Rector E. Cole, a prominent dentist and City Council member who was at the time of the school's founding president of the Oakland Board of Education **(Figure 59)**.[52]

Between 1892 and 1922, the Board of Education acquired several lots located to the north of the Cole School with the block bound by Union, 10th, Poplar, and 12th streets **(Figure 60)**. Acquisition of two residential lots immediately north of the original property resulted in the Cole School property's growth to roughly half the block's area.[53] In 1896, the Cole School served over 600 students.[54] The 1902 Sanborn map was the first to record the subject property and shows the original Cole School building had an L plan with a secondary, one-story rear volume. The map also shows the school property occupied the south half the block, with residential properties and five vacant lots within the northern half of the block **(Figure 61)**.

[55] W.W. Elliot, *Oakland and Surroundings*, (Oakland, CA: W.W. Elliot, 1885). Library of Congress.

By 1911, the subject site expanded slightly further northward through acquisition of the two more residential lots to the immediate north in 1905 and 1907.[56] A Manual Training building was built between 1902 and 1911 and stood near the center of the northern perimeter of the campus. A small one-story building with a triangular plan and an unknown use was illustrated to the west of the Cole School **(Figure 62)**. In 1912, four additional lots were acquired by the Board of Education, resulting in the school property's expansion to roughly 75 to 80 percent of the block's area. Around 1917, the Cole School's student population of around 700 students included relatively large groups of Italian- and Portuguese-American students.[57]

After World War I, the Board of Education acquired two additional parcels near the northeast end of the block, situated near the southeast corner of Poplar and 12th streets. These parcels were recorded on the 1911 Sanborn map as having an apartment or flats building and an adjacent residence. The Board of Education was permitted to alter the two-story flats building for Cole School use in 1922. The work was related to conversion of the residential building to use as a kindergarten facility.[58]

Figure 62: Sanborn-Perris Map Co.'s 1911 fire insurance survey map. Between 1902 and 1911 a Manual Training Rooms building was built near the rear of the school property. Properties acquired in 1912 are shaded red. Properties acquired in 1922 are shaded green. Source: San Francisco Public Library. Edited by Page & Turnbull.

In late December 1923, the original Cole Grammar School building was destroyed by arson, occurring shortly after arson destroyed the Lincoln School in Alameda and Woodland High School in Yolo County.[59] In the immediate days after, schools in Oakland were patrolled by fire department personnel and police.[60]

Between 1924 and 1925, the first iteration of the existing, subject Cole School building was designed and constructed, while temporary school buildings were placed at the subject site. The cornerstone for the Cole School building that currently stands at the subject property was laid in May 1925.[61] Funding provided by a school bond building program that enabled over 300 classrooms to be added throughout Oakland's school district.[62] An architect or designer was not identified on original plans

prepared for the City of Oakland Board of Education, which presented a Late Gothic Revival design with a brick exterior and cast cement exterior ornamentation, across a U-shaped plan **(Figure 63 to Figure 66)**. Key features of the 1925 design included a cast cement beltcourse at the sill line of the first story windows, two-story main body, and parapet. The building also featured pointed arch entrances and projecting oriel windows over the entrances along the south façade. Windows were arranged in groups of five within each bay and were six-over-six, divided-lite, wood-sash windows with individual three-lite transoms above. Recessed spandrel panels quatrefoils were recessed slightly behind the brick exterior walls, creating a horizontal division between the first and second stories. The brick exterior walls between each grouping of windows featured quoins.

The builder of the school in 1925 was identified as Alfred Olson.[63] Plans for the school were confirmed in March 1925, but one year later, the Superintendent of buildings and grounds for Oakland schools recommended that the nearly complete building's as-built design be rejected, due to Olson's failure to comply with the material specifications".[64]

In 1936, following the passage of the Field Act of 1933, and likely stemming further from previously determined deficiencies in the Cole School's design including major water infiltration problems, the school was renovated with a Moderne style exterior **(Figure 67 to Figure 71)**. Exterior brick and cast concrete ornamentation and window mullions were removed and replaced with cement plaster exterior surfaces and wood, respectively. Based upon plans prepared under the supervision of architect and engineering consultant William G. Corlett, most window openings retained their original locations and dimensions. A similar approach was undertaken with entrances throughout the building, resulting is a very similar overall massing, fenestration pattern, and building footprint, yet very different exterior materials.

During the decade between 1936 and 1946, the subject site featured the Cole School building at its south end, with open land along the remainder of the block. An aerial photograph taken in 1946 shows several trees were standing along the east and west sides of the property **(Figure 72)**. Peralta Villa, a segregated public housing community constructed in the early 1940s was to the west and southwest of the Cole School property. The area immediately east of the subject property contained older residential properties developed around the turn of the 20th century. The property north of the subject property, opposite 12th street was developed in 1915 as a food production facility, and introduced industrial use into the vicinity. A railroad spur located immediately west of the facility would later be extended southward, clipping the northeast corner of the subject property, with rail tracks extending southward along Union Street.

In 1949, the Cafeteria building was designed by Oakland-based architect, Edward O. Blodgett. The one-story, hybrid reinforced-concrete and wood-frame building was described as a new "wing" to the Cole School when it was dedicated in March of 1950 **(Figure 73 to Figure 76)**. The Cafeteria building was also designed to house the school's music program and had one additional classroom and an overall capacity for 214 students.[65] Plans prepared by Blodgett specified two skylights that do not appear on the existing building. At the north façade, the entrance at the center of the façade was specified to be surrounded by glass block, which has since been replaced.

In 1952, an updated Sanborn map was published and is the first available Sanborn map to record the subject the Cole School building following its façade reconstruction in 1936, and the Cafeteria building for the following its original construction in 1949. Five detached, one-story classroom buildings were aligned north to south along the east perimeter of the site. No additional buildings or structures were recorded at the property **(Figure 77)**.

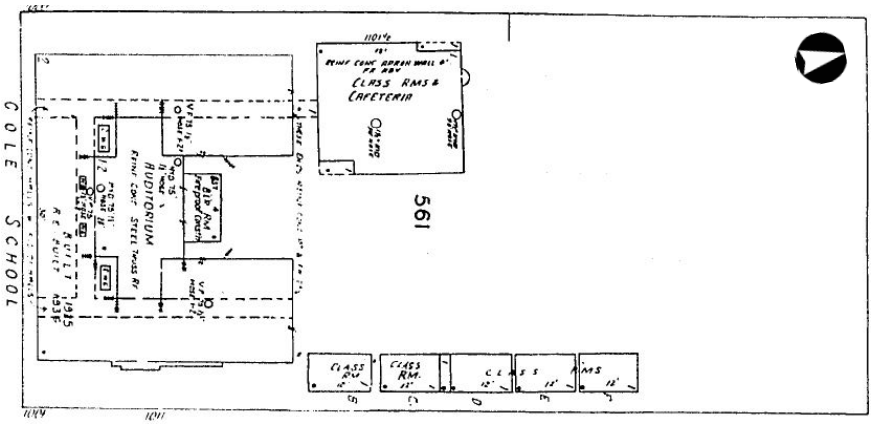

Figure 77: Sanborn-Perris Map Co.'s 1952 fire insurance survey map illustrating the second Cole School building following its façade reconstruction in 1936. The Cafeteria building (1949) and several one-story classroom buildings near the east perimeter of the site were also illustrated on the map. Source: San Francisco Public Library.

By 1961, three additional detached classroom buildings were built along the west perimeter of the site. These buildings featured a similar height and dimension to the five classroom buildings situated along east perimeter, recorded in 1952. No changes were illustrated at the Cole School or Cafeteria buildings **(Figure 78)**. The aforementioned railroad track wrapping around neighboring property to the north of the Cole School was extended southward. This was enabled by sale of a small corner parcel containing roughly 660 square feet of area to the Western Pacific Railroad by around 1956.[66] Within the subject site, the Cole School, Cafeteria building, and single, detached classroom building along the east perimeter of the site were recorded. By this time, it appears that he majority of the site's surface was paved, rather than grass **(Figure 79)**.

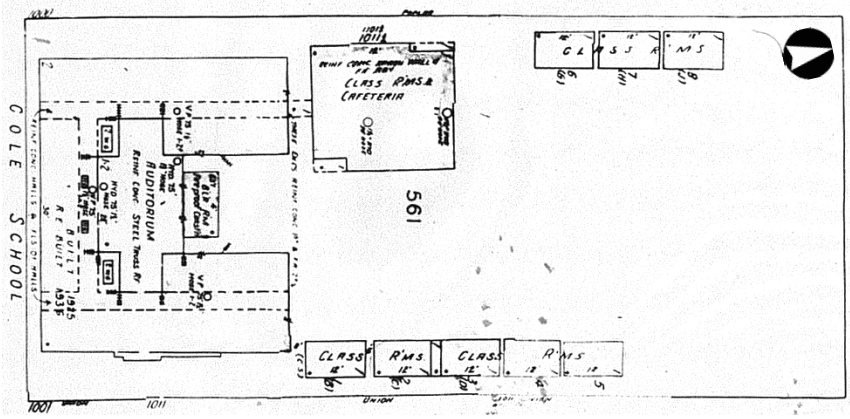

Figure 78: Sanborn-Perris Map Co.'s 1961 fire insurance survey map illustrating the subject property. The Cafeteria building (1949) and eight (8) one-story classroom buildings situated along the east and west perimeters of the site were also illustrated on the map. [66] Cole Diagram, October 9, 1956. This document illustrates parcels within the Cole School property by 1956. Provided to Page & Turnbull by OUSD. See also, excerpts of Board Minutes of November 20, 1956. Provided to Page & Turnbull by OUSD.

During the 1960s period of redevelopment, Cole School continued to operate as an elementary school and served a primarily African American student body, according to a newspaper report.[67] As of 1965, the property had its current dimension and featured the two subject buildings along with a single temporary school building at the east perimeter of the site, just north of the Cole School's east wing **(Figure 79)**.

Figure 79: Aerial photograph of subject property and vicinity, 1965. Source: UC Santa Barbara Library Special Collections, Cartwright Aerial Surveys, Flight CAS_65_130, Frame 15-117.

As part of the redevelopment plan, the Board of Education argued a new model school should be constructed to induce middle class whites to move back into West Oakland.[68] Some funding was to be set aside to renovate the Cole School which was described as "outmoded".[69] The redevelopment plan proposed to close or abandon the section of 12th street bordering the Cole School property to the north as part of an effort to expand the school property. This led to controversy regarding the impact of the closure of the street on the ability for police and fire departments to maintain accessibility to the area, in addition to concerns over traffic loads along 10th Street.[70]

By September of 1968, over 1,700 units of pre-existing housing were demolished in the Acorn redevelopment area to be replaced with 1,000 units in what was described in the *Oakland Tribune* as a "slum clearance program."[71] Within the Oak Center plan, roughly 650 to 1,500 new housing units were planned as renewal efforts in the area were said to be focused on rehabilitation of existing housing rather than clearance.[72] In 1967, the first private residential rehabilitation project began, and the Oakland Redevelopment Agency hoped that another 600 homeowners would participate in the rehabilitation program over the next three years. Nonetheless, the area plan still called for a displacement of around 4,000 residences "living either in areas that are too far gone to rehabilitate or are in areas slated for "public taking" for parks and schools.

[72] Ibid.

At the subject property, several temporary school buildings were relocated to the property between 1963 and 1968, however, these structures were removed from the site by 1980, based on review of historic aerial photography.

In 1973, the Cole School was closed for renovation in lieu of replacement by a new school building, and appears to have remained closed until ca. 1975 as the Oakland Redevelopment Agency and the Board of Education worked through funding issues related to the school's renovation.[73] During this time the exterior staircases and elevator at the rear wings of the building were constructed.[74] By 1980, 12th Street was closed between Union and Poplar Streets, and replaced with green space **(Figure 80)**. The Cole School converted from original use as an elementary school to that of a middle school in 1980, and continued to operate as such until 2009, when it was closed as a school. The building began its present use housing administrative offices for OUSD and the OUSD Police Unit.

Figure 80: 1980 aerial photograph of subject property and vicinity. Source: UC Santa Barbara Library Special Collections, Western Aerial Photos, Flight GS-VEZR, Frame 1-25.

Review of available aerial photographs shows the existing fence separating the OUSD Police Unit's parking area was installed ca. 2009 to 2010. The existing playground area with a basketball court was installed at the north end of the site ca. 2010 to 2012 **(Figure 81 and Figure 82)**.

CONSTRUCTION CHRONOLOGY

The following provides a timeline of construction and alterations to 1011 Union Street based on available building permits and plans on file with the City of Oakland or included in the Oakland Cultural Heritage Survey property files. Some permits available on microfiche were poorly scanned and are illegible. Some permits are incomplete and do not include full date information or permit number information. The following table includes only those for which the microfiche permits can be deciphered, and those which are digitized and appear to have been implemented. Copies of the digitized permits are appended to this report **(see Appendix B)**.

Date	Permit	Owner	Builder/Contractor	Description
1/3/1924	86959	City of Oakland	J.R. Faulkes, Builder	Eight portable classrooms.
3/12/1924	70525	City of Oakland	F.J. Maurie, Builder	Partitions at two-story flats building at 12th and Poplar streets to be used as a kindergarten.
3/2/1925	Original Plans on file with OUSD Permit A2200.	Board of Education	Oakland Public Schools Buildings and Grounds Department Contractor, Alfred Olson	Cole School, Polar, 10th, and Union Streets for the Oakland School District. Original Construction. Two-story brick and concrete school.
4/27/1936	A64176	Board of Education	William G. Corlett, Architectural and structural consultant Carl N. Swenson, Building Contractor	Façade Reconstruction of Cole School.

Date	Permit	Owner	Builder/Contractor	Description
7/27/1943	A99397	Board of Education	Oakland Public Schools, Architect H.J. Christensen Co. & W.E. Lyons Construction Co., Contractor	Portable classrooms. Notes size of each building as 22 feet by 35.5 feet.
7/27/1943	A99398	Board of Education	Oakland Public Schools, Architect H.J. Christensen Co. & W.E. Lyons Construction Co., Contractor	Portable classrooms.[75]
8/9/1949	B28435	Board of Education	Edward O. Blodgett, Architect Hall & Pregnoff Structural Engineers G.M. Simonson Mechanical Engineer	Construct Cole School Cafeteria building.
6/12/1952	B42552	Board of Education	George B. Green, Contractor	Permit to erect a building 22 feet by 35 feet in size for public school use.
6/19/1952	B42[illegible]	Board of Education	George B. Green, Contractor	Permit to erect a building 22 feet by 35 feet in size for public school use.
2/17/1964	HM474	Oakland Public School	Ayen House Movers	Relocate a portable classroom from Rear of 920 Campbell Street Foothill Boulevard to the 1011 Union Street.
6/26/1968	HM781	Oakland Public Schools	Ayen House Movers	Relocate a portable classroom from 915 Foothill Boulevard to the 1011 Union Street.
7/28/1969	2512	Oakland City School	Newton Bros., House Moving	Move portable school building from 824 29th Avenue (Lazear School) to Cole School property.

[75] All former portable classroom buildings constructed at or relocated to the subject property between 1943 and 1969 were detached buildings and are no longer extant.

Date	Permit	Owner	Builder/Contractor	Description
8/3/1973	N/A	Board of Education	Van Bourg/Nakamura & Associates architecture and planning	Cole School remodeling. New staircases at rear wings. Replacement Hollow metal doors and some solid-core doors installed. Reroof entire 2nd floor roof except for roof at auditorium and boiler room.
7/26/1983	3182	Not listed	Roto Rooter Sewer, Contractor	Permit to excavate in streets or other work as specified: sewer repair.
7/22/1998	X9800536	Not listed	Not listed	Trenching for tank removal.
8/2/2010	X1001020	Not listed	PG&E	Trench on Union Street for PG&E primary line service upgrade.
2/22/2013	ZC130458	Not listed	Not listed	Zoning clearance for relocated café within School District Headquarters.
5/6/2015	CGS15053	Not listed	Not listed	New driveway per approved plans per City Standard.
9/29/2016	ENMI16214	Not listed	Note listed	Bike Share Program bike rack.

A building permit application or project plans relating to replacement of windows within the Cole School building was not found. The windows appear to have been replaced ca. 1973-1990 as the current windows were documented by the Oakland Cultural Heritage Survey in 1990, while the original windows were described on plans for remodeling the school in dating to 1973.

OWNERSHIP/OCCUPANCY HISTORY

As described above, the site upon which the Cole School building stands (Parcel 1) has been owned by the City of Oakland Board of Education or OUSD since 1875. Parcels 2-8, 13, and 14 were acquired between 1892 and 1922, expanding the area of the property northward. Parcels 9 through 12 were acquired between 1922 and 1956. In 1956, a portion of Parcel 9 was conveyed to the Western Pacific Railroad, giving the subject property its distinct clipped northeast corner **(Figure 83)**.[76]

Between 1875 and 1993, the property was owned by the City of Oakland's Board of Education, as listed on deeds and building permit records. In 1993, the Board of Education conveyed its interest in the property to OUSD.

[76] Deed records and the Diagram of the Cole School property were provided to Page & Turnbull by OUSD, November 2019.

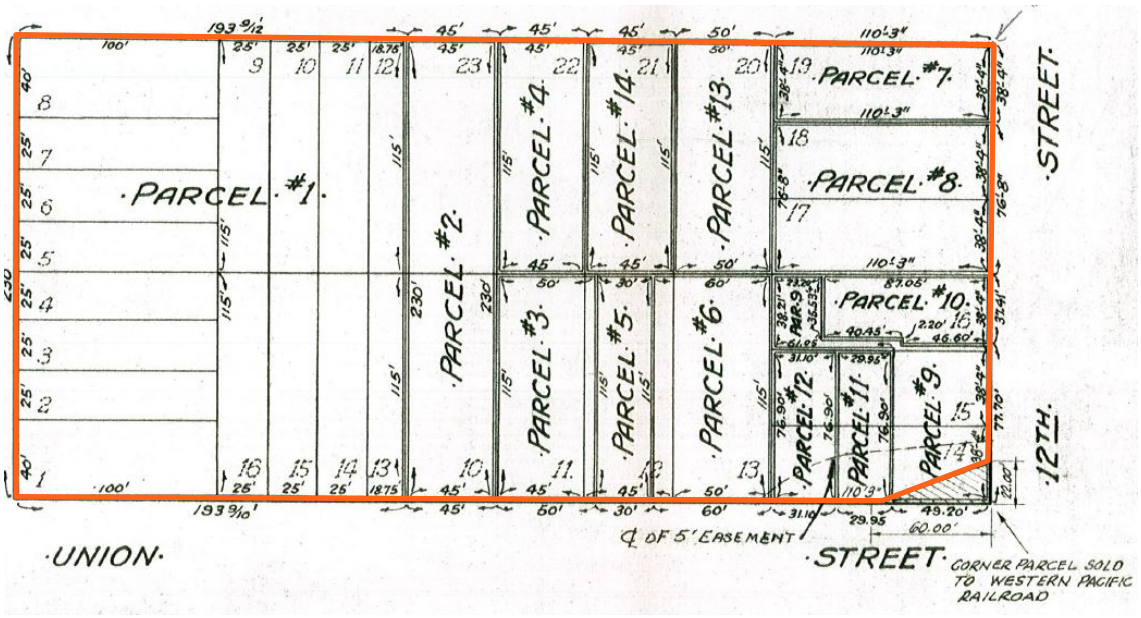

Figure 83: Diagram of Cole School property, listing parcels as categorized by OUSD, superimposed over an Assessor's Block Map, 1956. The current approximate boundary of 1011 Union Street is outlined with orange. Source: OUSD. Edited by Page & Turnbull.

FIELD ACT 1933

Passed shortly after the devastating Long Beach Earthquake of 1933, which destroyed seventy schools, the Safety of Design and Construction of Public School Buildings Act, or Field Act, of 1933 (Education Code §§17280-17317 and 80030-81149) required that school buildings in California meet high standards for safety. Adopted by the State of California, the act was enforced through plan review and inspection. While the original Field Act only applied to new construction, subsequent related acts would require some existing buildings to adhere to Field Act standards.[77] The subject Cole School building was subject to reconstruction at the exterior in 1936, three years after the enactment of the Field Act.

MODERNE ARCHITECTURAL STYLE

The Moderne style, also referred to as Art Moderne and Steamline Moderne, is a late Art Deco architecture style that appeared in commercial buildings, public buildings, theaters, gas stations, and residential buildings between ca. 1930 and ca. 1950.[78] It emerged in Germany in the work of the New Objectivity artists and in the buildings by architects involved in the German Werkbund, led by Hermann Muthesius. Taking cues from the Werkbund, American designers were similarly interested to strip Art Deco of its excessive ornamentation and focus on its streamlined aesthetic, especially during the Great Depression in the 1930s. The concepts of efficiency and speed, as well as aerodynamic form, took precedence over unnecessary decoration and espoused technological achievement and faith in the future.[79] The Streamline variant of the style is characterized by curving, often cylindrical, forms; rounded edges; flat roofs; subdued colors; and long, horizontal lines, as opposed to the vertical emphasis of Art Deco.[80] Occasionally, it also features nautical elements. The

[78] Mary Brown, *San Francisco Modern Architecture and Landscape Design 1935-1970 Historic Context Statement*, (San Francisco, CA: San Francisco Planning Department, January 12, 2011), 117-118.
[79] Marcus Whiffen, *American Architecture Since 1780: A Guide to the Styles, Rev. Ed,* (Cambridge, MA: MIT Press, 1992), 241.
[80] "Moderne Style 1930 – 1950," Pennsylvania Historical and Museum Commission, online. Accessed November 21, 2019. http://www.phmc.state.pa.us/portal/communities/architecture/styles/moderne.html.

style became popular in both architecture and the design of everyday objects and was "inspired by America's love affair with machines---the airplane, the car, the train, and the toaster," as described by architectural historian Lester Walker.[81] Marcus Whiffen describes the style as follows:

> Streamline Moderne is a horizontal style. In the overall form of the building as a rule, and always in the main elevations, horizontality prevails, with vertical features (if employed at all) reserved for the entrance. Secondly, it is a style of curved surfaces - curved end walls, curved corners, curved bays, and cylindrical projections. Thirdly, it is a style quite without ornament, apart from stringcourses and other trim emphasizing the horizontality of the design. In larger buildings the upper stories are often set back. Roofs are flat and parapeted. The parapets are often surmounted by pipe railings, producing a nautical effect that may be intensified by pipe railings on balconies and outside stairs, by round windows like portholes, and even by imitation rivets. Walls, brick or concrete, are usually plastered. Glass block is much used for translucency and textural contrast. [82]

Prominent Bay Area examples of the application of the Moderne style include: Swan's Market in Oakland, built 1917 with Moderne style alterations; San Francisco Maritime Museum, built ca. 1949; and the Mayway Corp. building at 1340 Cypress Street (now Mandela Parkway), built 1939-1940 **(Figure 84 to Figure 87)**.

OAKLAND PLANT IS ARCHITECTURAL MODEL

The Oakland plant of the Coca-Cola Bottling Company at 1340 Cypress Street, is considered by architects to be one of the most attractive and modern industrial establishments of the Pacific Coast, exemplifying the principle of daylight lighting in modern architecture. The structure occupies approximately one city block.

WILLIAM GREENFIELD CORLETT, JR., ARCHITECT

William Greenfield Corlett, Jr. (1887-1954) (William G. Corlett) designed alterations relating to the façade reconstruction and restyling of the Cole School in 1936. Corlett was born in the Bay Area in 1887 became a second-generation architect, after his graduation from University of California, Berkeley in 1910. His father, William H. Corlett (1856-1937), was a prominent lumber mill owner and prolific architect in Napa County, who designed notable buildings including the Noyes Mansion (1902) and Napa Franklin Station Post Office (1933), among many others.[83] William G. Corlett received his Bachelor of Architecture from University of California, Berkeley in 1910, and was also a licensed structural engineer.[84] In 1912, Corlett partnered with Walter D. Reed as the firm Reed & Corlett, which lasted until Reed's death in 1933. Subsequently, Corlett maintained an individual practice in Oakland until his retirement in 1944. Corlett's *Oakland Tribune* obituary noted that Henry Gutterson was his "long-time partner" in architecture.[85] While in independent practice, Corlett worked as the consulting architect and engineer for Oakland Public Schools from 1933 to 1938, and is credited with the designs for Oakland High School (non-exant), McClymonds High School (extant), the subject Cole School, and a circular building for Berkeley High Community Theater (extant) **(Figure 88)**. Corlett lectured at University of California, Berkeley in 1924-25, and served as the chairman of the advisory board for the State Department of Public Works, division of architecture from 1933 to 1938.[86]

Corlett was a member of the American Institute of Architects, American Society of Civil Engineers, and American Society of Structural Engineers.[87] When Corlett died in 1954, his *Oakland Tribune* obituary stated that Corlett was "an architect whose fame rests securely in the Oakland skyline."[88]

EDWARD O. BLODGETT, ARCHITECT

Edward Oscar Blodgett (1893-1962) was born in Woodland, California in 1893 and grew up in Oakland, California, where he based his career. By 1918, Blodgett began employment as a draftsman for the Hanlow Dry Dock & Shipbuilding Co. in Oakland. Between 1916 and ca. 1922, Blodgett also served as a private in the military reserve and had trained as a military cadet at a California institution, according to his Draft Registration Card for World War I.[89] Blodgett listed his occupation as architect in 1923, and by 1926 became employed as a draftsman with the City of Oakland's Board of Education.[90]

In 1930, the Oakland City Directory listed Blodgett as an architect with the prominent firm of Reed & Corlett, led by William G. Corlett and Walter G. Reed. Around 1934, Blodgett began a 15-year tenure as a draftsman and architect working for Oakland's public school system.[91] The initials E.O.B appear on approved plans for the Cole School's 1936 façade reconstruction and exterior redesign, indicating Blodgett served in a draftsman capacity for the project, and likely others, that were supervised by Corlett. By 1938, Blodgett sat on a board of advisors for the State Association of California Architects' Northern Section and was Eastbay adviser of the same association.[92] Blodgett retired from his position with the City of Oakland in 1949 and moved to Ventura, California around 1955. Design of the Cafeteria building at the Cole School property appears to have been among the last projects of Blodgett's career. By 1949, when Blodgett designed the Cafeteria building at the subject property, he resided at 1989 Hoover Avenue in Oakland. Blodgett died in 1962 while residing in Ventura.[93]

VI. EVALUATION

CALIFORNIA REGISTER EVALUATION CRITERIA

The California Register is an inventory of significant architectural, archaeological, and historical resources in the State of California. Resources can be listed in the California Register through a number of methods. State Historical Landmarks and National Register-listed properties are automatically listed in the California Register. Properties can also be nominated to the California Register by local governments, private organizations, or citizens. The California Register of Historical Resources follows nearly identical guidelines to those used by the National Register but identifies the Criteria for Evaluation numerically. In order for a property to be eligible for listing in the California Register, it must be found significant under one or more of the following criteria.

- *Criterion 1 (Events)*: Resources that are associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

- *Criterion 2 (Persons)*: Resources that are associated with the lives of persons important to local, California, or national history.

- *Criterion 3 (Architecture)*: Resources that embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic values.

- *Criterion 4 (Information Potential)*: Resources or sites that have yielded or have the potential to yield information important to the prehistory or history of the local area, California, or the nation.

Criterion 1 (Events)

The Cole School property at 1011 Union Street in West Oakland does not appear to be individually eligible under Criterion 1 (Events), as the property is not associated with significant events nor does it appear to have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States. The property originated as parcel roughly one-third its current size in 1875, when acquired by the Board of Education of the City of Oakland as an apparently vacant site. The site's original development ca. 1880 occurred more than two decades after the City of Oakland's first school was established in 1853 and does not appear to stand out individually within the context of the development of public education in Oakland, the State, or the nation.

By 1880, the Cole Grammar School, a two-story Gothic Revival style building stood at the site. Until 1923, when the original school building burned, the Cole Grammar School educated numerous children, perhaps most notably famed author, Jack London. The existing building was originally constructed in 1925 and renovated in 1936 in a Moderne style. The building does not date to the earliest school development of the property in 1875; rather it reflects widespread changes in the design of educational buildings that took place in the 1930s in association with the Field Act of 1933, which resulted in reconstruction or heavy alteration of many schools throughout the State to meet updated seismic safety standards. Although the Cole School building reflects changes likely brought on by the Field Act, it does not possess individual significance relative to other educational buildings that were reconstructed or altered under similar auspices.

During the mid-20th century, and particularly after 1965, the Oak Center neighborhood and the nearby vicinity in West Oakland was greatly impacted by urban renewal planning efforts. The Cole School property, inclusive of the Cole School, Cafeteria building, and several portable classrooms on the property, were located within the Oak Center Redevelopment Plan area, considered among the largest on the West Coast as of 1965. However, the Cole School property and associated buildings were completed prior to the creation of the plan, and do not bear significant individual association to the plan effort as no major alterations to the property provide a strong representation of that particular period. Rather than the Cole School having been constructed as part of the plan, the plan was set in place in the nearby blocks around the existing school property.

The existing Cole School building is not known to have been the location of any singular events with significance to the history of Oakland, the State, or the nation. The Cafeteria was designed and built as a secondary or supplementary building within the campus. Research did not find information to support a finding of significance under this criterion.

Criterion 2 (Persons)

1011 Union Street does not appear to be individually eligible under Criterion 2 (Persons). The Cole Grammar School (non-extant) was named for a prominent Oakland dentist and president of the Board of Education, Rector E. Cole. Although the school's name carried on after the destruction of the original school building in 1923, the existing buildings and property do not bear significant association to Cole, as they do not represent Cole's achievements in dentistry or as a member of the Board of Education, and were built after Cole's professional, productive life occurred. Archival research did not find that any past staff employed by the Cole School ca. 1925 or later made significant contributions to local, State, or national history. The school's notoriety as having been the Jack London's elementary school is not reflected by the existing buildings and property which were developed after London attended the Cole Grammar School.

Criterion 3 (Architecture)

1011 Union Street does not appear to be individually eligible under Criterion 3 (Architecture). The subject property was originally developed ca. 187-1880 with a two-story, Gothic Revival school building, which stood at the site and operated as the Cole Grammar School until it was destroyed by fire in 1923. In 1925, the existing building known as the Cole School was built with a Late Gothic Revival style aesthetic but suffered from material deficiencies. After the passing of the Field Act of 1933, the school building was heavily renovated and restyled in the then emergent Moderne aesthetic, by noted Oakland-based architect and engineer, William G. Corlett, who served contemporaneously as a consulting design professional to the City's Board of Education. Corlett's association to the Cole School's alterations is notable, however, the building does not appear to be among the most important works of his career, which included other City of Oakland public school buildings and several prominent institutional buildings across the Bay Area region. The Cole School does not bear the same strength of association with Corlett's career as buildings that were designed in their entirety by Corlett. Rather, the Cole School building represents Corlett's role in redesigning a pre-existing work of architecture.

The Cole School building embodies the horizontal emphasis and massing commonly seen in Moderne style buildings ca. 1936 and features a modest exterior material palette and limited ornamentation. The building lacks the fusion of curvilinear forms across its massing, such as curved bays and corners, that would enable it to stand out as a very strong local representation of the style's application to an education building. Rather, the Cole School is representative of the application of the Moderne style, to a pre-existing, formerly Late Gothic Revival school. The building's fenestration pattern largely reflects its originally design, despite alterations, but does not stand out as a particularly important example of an education building designed in 1925, and renovated and restyled in 1936.

The Cafeteria building was designed in 1949 by Oakland-based architect Edward O. Blodgett, who served as a draftsman and architect for the City of Oakland's Board of Education between 1934 and 1949, after having worked with William G. Corlett and Walter Reed of Reed & Corlett as a draftsman. Research did not find that Blodgett was a particular important designer relative to his contemporaries. The Cafeteria building is designed in a modest, modern form that communicates the building's use as an educational building more so than a particular architectural style. The building does not have characteristics that enable it to stand out as an individually distinct example of an education building constructed in 1949 in Oakland.

Overall, the two age-eligible buildings within the former Cole School property, and the site as a whole do not stand out as individually significant entities under this criterion.

Criterion 4 (Information Potential)

The "potential to yield information important to the prehistory or history of California" typically relates to archeological resources, rather than built resources. When California Register Criterion 4 (Information Potential) does relate to built resources, it is for cases when the building itself is the principal source of important construction-related information. The subject property does not appear to feature construction or material types, or embody engineering practices that would, with additional study, provide important information. Page & Turnbull's evaluation of this property was limited to age-eligible resources above ground and did not involve survey or evaluation of the subject property for the purposes of archaeological information.

CITY OF OAKLAND THRESHOLDS OF SIGNIFICANCE

As 1011 Union Street is not listed in and does not appear to be eligible for the California Register, the subject property does not meet Criteria 1 and 4 of the City of Oakland's Thresholds of Significance Guidelines for historical resources under CEQA. The subject property is not currently listed on Oakland's Local Register (Threshold of Significance Criterion 2) and was previously assigned an Individual Property Rating of "C3" by the OCHS. The Individual Property Rating indicated the building appeared to be of secondary importance and is not located within a historic district or Area of Primary or Secondary Importance. The current evaluation by Page & Turnbull finds that the OCHS rating of "C3" remains applicable to the subject property. This rating would not qualify the property for listing in Oakland's Local Register, corresponding to a California Historical Resource Status Code of 6 (Threshold of Significance Criterion 3). Unless found uniquely significant to Oakland's history by City Council (Threshold of Significance Criterion 5), preliminary review of the subject property indicates that it is unlikely to meet the requisite criteria to attain the status of historical resource under CEQA.

INTEGRITY

In order to qualify for listing in any local, state, or national historic register, a property or landscape must possess significance under at least one evaluative criterion as described above and retain integrity. Integrity is defined by the California Office of Historic Preservation as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance," or more simply defined by the National Park Service as "the ability of a property to convey its significance."[94]

As the subject property does not appear to be significant under any of the criteria for listing in the California Register, an analysis of the property's historic integrity is not included in this report.

[94] California Office of Historic Preservation, *Technical Assistance Series No. 7: How to Nominate a Resource to the California Register of Historical Resources*, (Sacramento: California Office of State Publishing, 4 September 2001), 11; U.S. Department of the Interior, National Park Service, *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*, (Washington, D.C.: National Park Service, 1995), 44.

VII. CONCLUSION

The property at 1011 Union Street contains two buildings formerly used as Cole School, which operated as an elementary school between 1925 and 1980, and as a middle school from 1980 until its closure in 2009. The subject property exists as an expanded OUSD property that was originally roughly 1/3 the size when acquired by the City's Board of Education in 1875. The existing Cole School building was built in 1925 and underwent extensive renovation in 1936, with alterations designed by consulting architect William G. Corlett. The Cafeteria building was built in 1949 with design by architect Edward O. Blodgett, a draftsman-architect who worked for both Corlett and Oakland Public Schools before starting an individual practice in 1949. Research did not find that property at 1011 Union Street is significantly associated with historic patterns of development in Oakland, the State, or the nation. Similarly, none of the former staff or students of the school appear to have made significant contributions to history. Neither building appears to provide an individually distinct example of a style, type, period, or method of construction that would enable it to be significant based upon the merits of its design. Therefore, 1011 Union Street does not appear to qualify as an eligible historic resource for the purposes of review under the California Environmental Quality Act (CEQA).

MANAGEMENT SUMMARY

The Oakland Unified School District (OUSD) is proposing the Central Administration Center at Cole Campus Project (Project) which includes the demolition of the cafeteria building and 1925-era Cole Middle School building and all other structures on the Project site, removal of all surface pavement and perimeter fencing, and construction of a 2-story 56,000 square foot central administration building and a 4,100 square foot 1-story building containing a multi-purpose room in Oakland, Alameda County, California. PaleoWest was contracted by Lamphier-Gregory to conduct an archaeological desktop review of the 2.8-acre Project area in compliance with the California Environmental Quality Act (CEQA). The OUSD is the Lead Agency for the purposes of the CEQA.

This report summarizes the methods and results of the desktop review of the Project area. This investigation included a cultural resource literature search, communication with the Native American Heritage Commission (NAHC) and interested Native American tribal groups. No fieldwork was conducted for this cultural resource assessment as the entire Project area is fully developed and hardscaped. The purpose of the investigation was to determine the potential for the Project to impact historic resources for the purposes of CEQA.

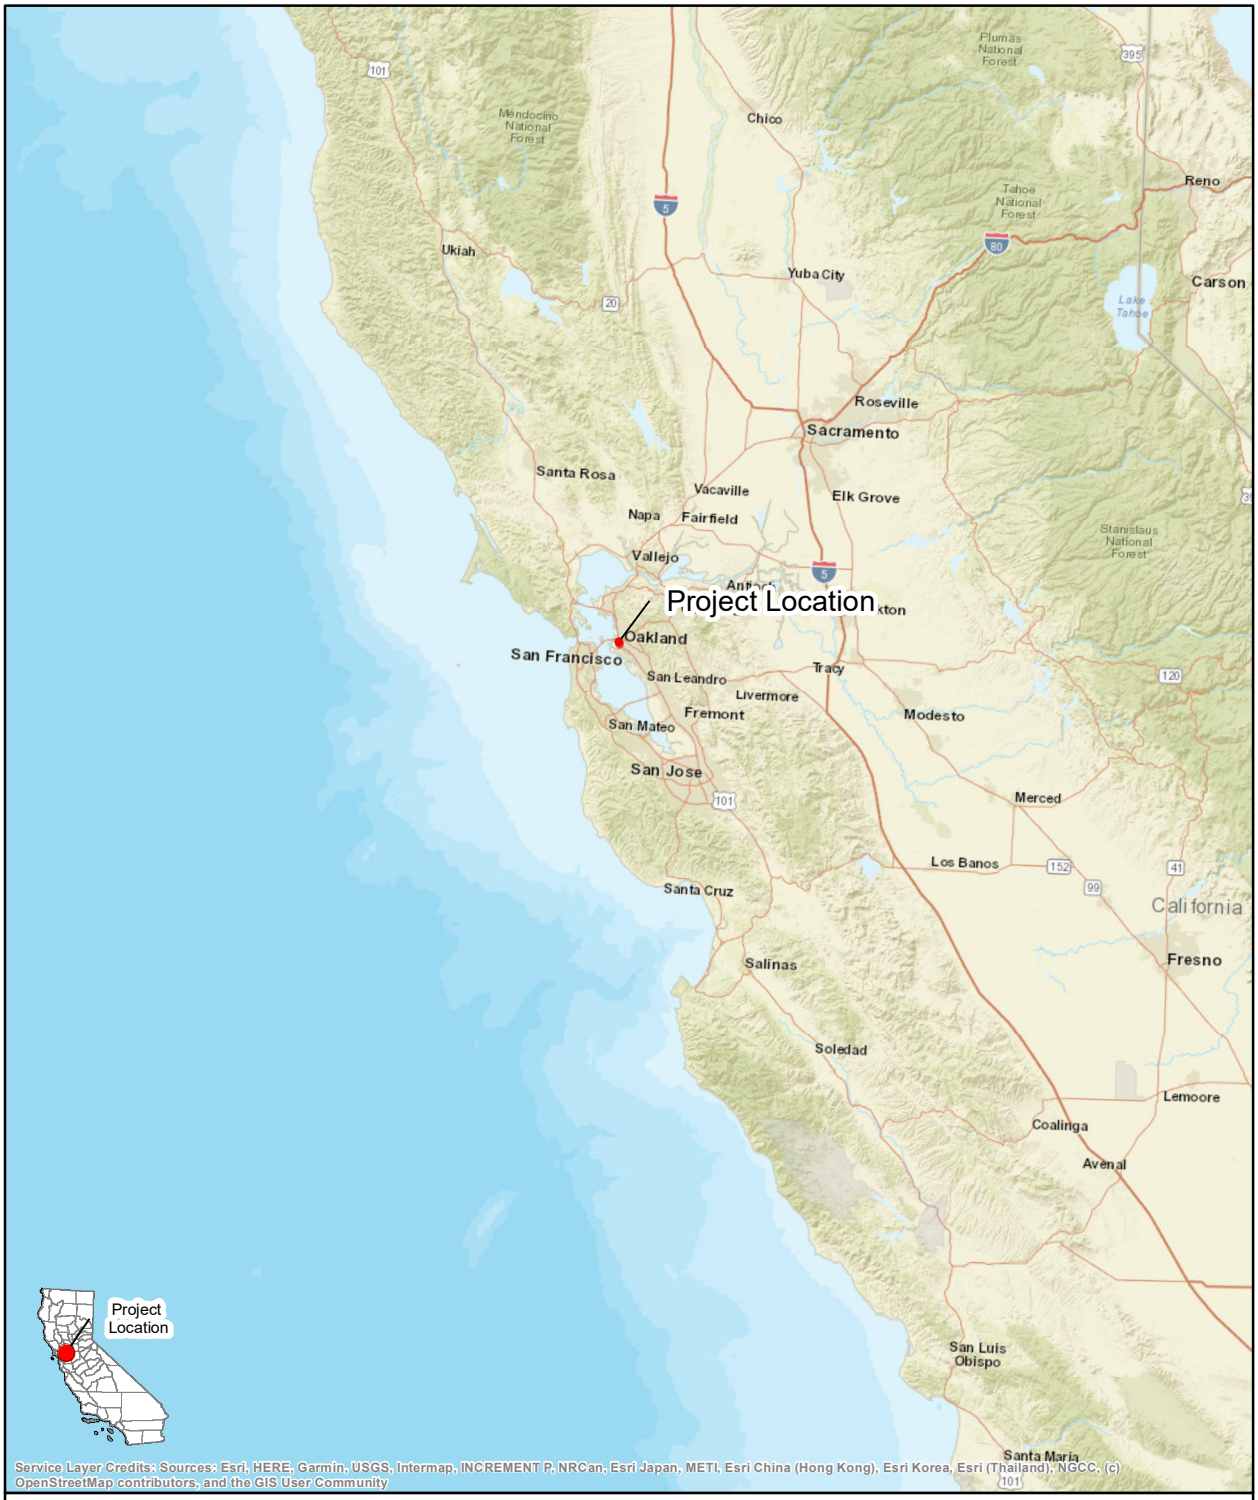
On January 24, 2020, Paleowest Archaeologist Zack Babineau conducted a records search at the Northwest Information Center (NWIC), at Sonoma State University, for the Oakland Unified School District Central Administration Center Survey (File No. 19-1233). The records search indicated that no fewer than 62 previous studies have been conducted within ¼-mile of the Project area. No cultural resources have been recorded within the Project area.

As part of the cultural resource assessment of the Project area, PaleoWest also requested a search of the Sacred Lands File (SLF) from the NAHC. Results of the SLF search were positive and they recommended contacting seven individuals/representatives of seven Native American tribal groups to find out if they have additional information about the Project area. All seven individuals were contacted. No responses were received.

In order to reduce potential impacts of the Project on known or potentially significant cultural resources, PaleoWest provides a set of management recommendations including an archaeological survey and procedures for inadvertent discoveries.

1.0 INTRODUCTION

The Oakland Unified School District (OUSD) proposed the Central Administration Center at Cole Campus Project (Project) which includes the demolition of the cafeteria building and 1925-era Cole Middle School building and all other structures on the Project site, removal of all surface pavement and perimeter fencing, and construction of a 2-story 56,000 square foot central administration building and a 4,100 square foot 1-story building containing a multi-purpose room in Oakland, Alameda County, California. PaleoWest was contracted by Lamphier-Gregory to conduct an archaeological desktop review of the 2.8-acre Project area in compliance with the California Environmental Quality Act (CEQA). The OUSD is the Lead Agency for the purposes of the CEQA.



1.1 PROJECT LOCATION AND DESCRIPTION

The approximately 2.8-acre Project site is currently occupied by the former Cole Middle School and former cafeteria building along with paved surface parking for Oakland Unified School District (OUSD) personnel. The Project address is 1011 Union Street, Oakland. The Project site involves the entire block bounded by Union Street, 10th Street, Poplar Street and the south boundary of the Wade Johnson Park. Assessor's Parcel Number 04-53-7 (Figure 1-1). The Project area is located within unsectioned land in a developed section of Downtown Oakland, with no Township or Range, on the 1997 Oakland West, California 7.5' United States Geological Survey (USGS) topographic quadrangle (Figure 1-2).

The Project involves demolition of the cafeteria building and 1925-era Cole Middle School building and all other structures on the Project site, removal of all surface pavement and perimeter fencing, and construction of a 2-story 56,000 square foot central administration building and a 4,100 square foot 1-story building containing a multi-purpose room. The new main building will house the OUSD administrative staff, currently occupying rental space at 1000 Broadway. The new administration building would include a formal room for OUSD Board hearings, office space for administrative staff, and conference rooms. The multi-purpose room will provide space to accommodate overflow during Board meetings, a location to hold specialized educational curricula, and a place for larger District workshops. Other elements of the Project include surface parking for OUSD staff (69 spaces) and visitors (31 spaces), trees, shrubs and other landscape features, outdoor seating for staff and visitors, and night lighting.

1.2 REPORT ORGANIZATION

This report documents the results of a cultural resource investigation conducted for the proposed Project. Chapter 1 has introduced the project location and description. Chapter 2 states the regulatory context that should be considered for the Project. Chapter 3 synthesizes the natural and cultural setting of the Project area and surrounding region. The results of the cultural resource literature and records search conducted at the Northwest Information Center (NWIC) and the Sacred Lands File (SLF) search, and a summary of the Native American communications is presented in Chapter 4. The management recommendations are provided in Chapter 5. This is followed by bibliographic references and appendices.

Project Area

2.0 REGULATORY CONTEXT

2.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

The proposed Project is subject to compliance with CEQA, as amended. Compliance with CEQA statutes and guidelines requires both public and private projects with financing or approval from a public agency to assess the project's impact on cultural resources (Public Resources Code Section 21082, 21083.2 and 21084 and California Code of Regulations 10564.5). The first step in the process is to identify cultural resources that may be impacted by the project and then determine whether the resources are "historically significant" resources.

CEQA defines historically significant resources as "resources listed or eligible for listing in the California Register of Historical Resources (CRHR)" (Public Resources Code Section 5024.1). A cultural resource may be considered historically significant if the resource is 45 years old or older, possesses integrity of location, design, setting, materials, workmanship, feeling, and association, and meets any of the following criteria for listing on the CRHR:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,
4. Has yielded, or may be likely to yield, information important in prehistory or history (Public Resources Code Section 5024.1).

Cultural resources are buildings, sites, humanly modified landscapes, traditional cultural properties, structures, or objects that may have historical, architectural, cultural, or scientific importance. CEQA states that if a project will have a significant impact on important cultural resources, deemed "historically significant," then project alternatives and mitigation measures must be considered. Additionally, any proposed project that may affect historically significant cultural resources must be submitted to the State Historic Preservation Officer (SHPO) for review and comment prior to project approval by the responsible agency and prior to construction.

3.0 SETTING

This section of the report summarizes information regarding the physical and cultural setting of the Project area, including the prehistoric, ethnographic, and historic contexts of the general area. Several factors, including topography, available water sources, and biological resources, affect the nature and distribution of prehistoric, ethnographic, and historic-period human activities in an area. This background provides a context for understanding the nature of the cultural resources that may be identified within the region.

3.1 ENVIRONMENTAL SETTING

The San Francisco Bay region is defined by the San Francisco Peninsula on the southwest, the Marin Peninsula on the northwest, and the Berkeley Hills and the Diablo Range on the east. The heart of the region is the San Francisco Bay system, which occupies a late Pliocene trough that flooded repeatedly during the Pleistocene interglacials, the last flooding occurring approximately 10,000 years ago. This trough extends to the south where it forms the Santa Clara and San Benito valleys and to the north where it forms the Petaluma, Napa, and Sonoma valleys (Moratto 1984:219). About 15,000 years ago the coastal shoreline extended more than 15 miles west of today's coastline. The California River flowed through the gorge that is now the Golden Gate and across what is today's submerged continental shelf, finally reaching the ocean far west of today's coastline (Moratto 1984:219).

Approximately 8,000 years ago, with the rising sea levels associated with the melting of continental glaciers, marine waters began to invade the San Francisco trough, creating a lush and bountiful marshland environment on the shores surrounding a newly created bay. Elk, deer, and waterfowl inhabited the marshlands and surrounding environs. The waters of the bay and ocean produced abalone, oyster, mussels, clams, salmon, sturgeon, seabass, shark, perch, and many other fish species. Tule and marsh grasses provided raw material for a variety of implements fashioned by the earliest inhabitants.

The flanks of the coastal mountain ranges provide the biotic zone of the coastal grasslands. These mountain ranges are the product of tectonic activity caused by the collision of the Pacific continental plate and the continent of North America. A variety of geological composition and soil variability are the result of this activity. The geologic foundation underlying the coastal grasslands is largely granite bedrock intermixed with large areas of sedimentary shales, sandstones and composites of igneous rock (Brown 1997:86). Mineral resources for both tool manufacture and trade were abundant. Obsidian, prized for projectile points and blades, was available to the north at Anadel and Napa's Glass Mountain. Franciscan chert was found locally in streambeds and rock outcroppings while banded Monterey chert could be found in coastal deposits to the south (Moratto 1984:221).

Native grasses covered the middle-elevation hillsides in the coastal areas prior to the late 18th century. The grasses now covering the coastal grassland region are not the same as those that would have been found in the area 250 years ago. Although the types of animals inhabiting the coastal regions before the influx of humans are largely known, the type of plants that may have occupied the coastal grassland is not as well defined.

Annual precipitation in the San Francisco Bay region varies from 20 to 40 in. with precipitation concentrated in the fall, winter, and spring months. This climate is much like that found in the Mediterranean: mild, rainy winters, and warm, dry summers. After the first rain at the end of October or early November, the vegetation becomes and remains green, but not growing, until late February, when it begins to grow rapidly. By early May, grasses have usually changed to dry golden-colored and remain that

way until fall (Brown 1985:86). Due to the cooling effects of the local Bay environment, temperatures in the Project area are mild in the summer, usually averaging 55-65°F (Moratto 1984:223).

3.2 PREHISTORIC SETTING

Research into local prehistoric cultures began in the early 1900s with the work of N. C. Nelson of the University of California at Berkeley. Nelson documented 425 shellmounds along the Bay shore and adjacent coast when the Bay was still ringed by salt marshes three to five miles wide (Nelson 1909:322-331). He maintained that the intensive use of shellfish, a subsistence strategy reflected in both coastal and bay shoreline middens, indicated a general economic unity in the region during prehistoric times, and he introduced the idea of a distinct San Francisco Bay archaeological region (Moratto 1984:227). Three sites, in particular, provided the basis for the first model of cultural succession in Central California, the Emeryville Shellmound (CA-ALA-309), the Ellis Landing Site (CA-CCO-295), and the Fernandez Site (CA-CCO-259) (Moratto 1984:227).

Investigations into the prehistory of the Central Valley of California, presaged by early amateur excavations in the 1890s, began in earnest in the 1920s. In the early 20th century, Stockton-area amateur archaeologists J. A. Barr and E. J. Dawson separately excavated a number of sites in the Central Valley and made substantial collections. On the basis of artifact comparisons, Barr identified what he believed were two distinct cultural traditions, an early and a late. Dawson later refined his work and classified the Central Valley sites into three "age-groups" (Schenck and Dawson 1929:402).

Professional or academic-sponsored archaeological investigations in central California began in the 1930s, when J. Lillard and W. Purves of Sacramento Junior College formed a field school and conducted excavations throughout the Sacramento Delta area. By seriating artifacts and mortuary traditions, they identified a three-phase sequence similar to Dawson's, including Early, Intermediate, and Recent cultures (Lillard and Purves 1936). This scheme went through several permutations (see Lillard et al. 1939; Heizer and Fenenga 1939). In 1948 and again in 1954, Richard Beardsley refined this system and extended it to include the region of San Francisco Bay (Beardsley 1948, 1954). The resulting scheme came to be known as the Central California Taxonomic System (CCTS) (Fredrickson 1973; Hughes 1994:1). Subsequently, the CCTS system of Early, Middle, and Late Horizons was applied widely to site dating and taxonomy throughout central California.

As more data were acquired through continued fieldwork, local exceptions to the CCTS were discovered. The accumulation of these exceptions, coupled with the development of radiocarbon dating in the 1950s and obsidian hydration analysis in the 1970s, opened up the possibility of dating deposits more accurately. Much of the subsequent archaeological investigation in central California focused on the creation and refinement of local versions of the CCTS.

In the 1960s and 1970s, archaeologists including Ragir (1972) and Fredrickson (1973) revised existing classificatory schemes and suggested alternative ways of classifying the prehistory of California. Fredrickson (1973:113-114) proposed four "major chronological periods" in prehistoric California: the Early Lithic Period (described as hypothetical), a Paleoindian Period, an Archaic Period, and an Emergent Period. The Archaic and Emergent Periods were further divided into Upper and Lower periods. Subsequently, Fredrickson (1974, 1994) subdivided the Archaic into Lower, Middle, and Upper. Milliken et al. (2007) have recently updated and further refined this scheme.

A series of "patterns," emphasizing culture rather than temporal periods, can be identified throughout California prehistory. Following Ragir, Fredrickson (1973:123) proposed that the nomenclature for each

pattern relates to the location at which it was first identified, such as the Windmiller, Berkeley, and Augustine Patterns.

Various modifications of the CCTS (e.g., Bennyhoff and Hughes 1987; Fredrickson 1973, 1974; Milliken and Bennyhoff 1993) sustain and extend the system's usefulness for organizing our understanding of local and regional prehistory in terms of time and space. The cultural patterns identified in the Bay Area that in a general way correspond to the CCTS scheme are the Berkeley and Augustine patterns (for information on the Berkeley and Augustine Patterns see Fredrickson 1973, Milliken et al. 2007, Moratto 1984 and Wiberg 1997). Dating techniques such as obsidian hydration analysis or radiometric measurements can further increase the accuracy of these assignments.

Most recently, Milliken et al. (2007:99-123) developed what they term a "hybrid system" for the San Francisco Bay Area, combining the Early-Middle-Late Period temporal sequence with the pattern-aspect-phase cultural sequence. Dating of the cultural patterns, aspects, and phases was based on Dating Scheme D of the CCTS, developed by Groza (2002). Groza directly dated over 100 Olivella shell beads, obtaining a series of AMS radiocarbon dates representing shell bead horizons. The new chronology she developed has moved several shell bead horizons as much as 200 years forward in time.

Milliken et al.'s (2007) San Francisco Bay Area Cultural Sequence includes:

Early Holocene (Lower Archaic) from 8000 to 3500 B.C.
Early Period (Middle Archaic) from 3500 to 500 B.C.
Lower Middle Period (Initial Upper Archaic) from 500 B.C. to A.D. 430
Upper Middle Period (Late Upper Archaic) from A.D. 430 to 1050
Initial Late Period (Lower Emergent) from A.D. 1050 to 1550
Terminal Late Period, post-A.D. 1550

No archaeological evidence dating to pre-8000 B.C. has been located in the Bay Area. Milliken et al. (2007) posit that this dearth of archaeological material may be related to subsequent environmental changes that submerged sites, buried sites beneath alluvial deposits, or destroyed sites through stream erosion. A brief summary of the approach presented by Milliken et al. (2007) follows.

A "generalized mobile forager" pattern marked by the use of milling slabs and handstones and the manufacture of large, wide-stemmed and leaf-shaped projectile points emerged around the periphery of the Bay Area during the Early Holocene Period (8000 to 3500 B.C.). Beginning around 3500 B.C., evidence of sedentism, interpreted to signify a regional symbolic integration of peoples, and increased regional trade emerged. This Early Period lasted until ca. 500 B.C. (Milliken et al. 2007:114, 115).

Milliken et al. (2007:115) identify "a major disruption in symbolic integration systems" circa 500 B.C., marking the beginning of the Lower Middle Period (500 B.C. to A.D. 430). Bead Horizon M1, dating from 200 B.C. to A.D. 430, is described by Milliken et al. (2007:115) as marking a 'cultural climax' within the San Francisco Bay Area.

The Upper Middle Period (A.D. 430 to 1050) is marked by the collapse of the Olivella saucer bead trade in central California, abandonment of many Bead Horizon M1 sites, an increase in the occurrence of sea otter bones in those sites that were not abandoned, and the spread of the extended burial mortuary pattern characteristic of the Meganos complex into the interior East Bay. Bead Horizons M2 (A.D. 430 to 600), M3 (A.D. 600 to 800), and M4 (A.D. 800 to 1050) were identified within this period (Milliken et al. 2007:116).

The Initial Late Period, dating from A.D. 1050 to 1550, is characterized by increased manufacture of status objects. In lowland central California during this period, Fredrickson (1973, 1994) noted evidence for increased sedentism, the development of ceremonial integration, and status ascription. The beginning of the Late Period (ca. A.D. 1000) is marked by the Middle/Late Transition bead horizon. The Terminal Late Period began circa A.D. 1550 and continued until European settlement of the area.

3.3 ETHNOGRAHIC SETTING

This section provides a brief summary of the ethnography of the Project vicinity and is intended to provide a general background only. More extensive reviews of Ohlone ethnography are presented in Bocek (1986), Cambra et al. (1996), Kroeber (1970), Levy (1978), Milliken (1995), and Shoup et al. (1995).

The Project area lies within the region occupied by the Ohlone or Costanoan group of Native Americans at the time of historic contact with Europeans (Kroeber 1970:462-473). Although the term Costanoan is derived from the Spanish word Costaños, or "coast people," its application as a means of identifying this population is based in linguistics. The Costanoans spoke a language now considered one of the major subdivisions of the Miwok-Costanoan, which belonged to the Utian family within the Penutian language stock (Shipley 1978:82-84). Costanoan actually designates a family of eight languages.

Tribal groups occupying the area from the Pacific Coast to the Diablo Range and from San Francisco to Point Sur spoke the other seven languages of the Costanoan family. Modern descendants of the Costanoan prefer to be known as Ohlone. The name Ohlone is derived from the Oljon group, which occupied the San Gregorio watershed in San Mateo County (Bocek 1986:8). The two terms (Costanoan and Ohlone) are used interchangeably in much of the ethnographic literature.

On the basis of linguistic evidence, it has been suggested that the ancestors of the Ohlone arrived in the San Francisco Bay area about A.D. 500, having moved south and west from the Sacramento-San Joaquin Delta. The ancestral Ohlone displaced speakers of a Hokan language and were probably the producers of the artifact assemblages that constitute the Augustine Pattern previously described (Levy 1978:486).

Although linguistically linked as a family, the eight Costanoan languages actually comprised a continuum in which neighboring groups could probably understand each other. However, beyond neighborhood boundaries, each group's language was reportedly unrecognizable to the other. Each of the eight language groups was subdivided into smaller village complexes or tribal groups. These groups were independent political entities, each occupying specific territories defined by physiographic features. Each group controlled access to the natural resources of its territory, which also included one or more permanent villages and numerous smaller campsites used as needed during a seasonal round of resource exploitation. Chochenyo or East Bay Costanoan was the language spoken by the estimated 2,000 people who occupied the "east shore of San Francisco Bay between Richmond and Mission San Jose, and probably also in the Livermore Valley" (Levy 1978:485).

A chief, who inherited the position patrilineally and could be either a woman or man, provided leadership. The chief and a council of elders served mainly as community advisers. Specific responsibility for feeding visitors, providing for the impoverished and directing ceremonies, hunting, fishing, and gathering fell to the chief. Only during warfare was the chief's role as absolute leader recognized by group members (Levy 1978:487).

Extended families lived in domed structures thatched with tule, grass, wild alfalfa, or ferns (Levy 1978:492). Semisubterranean sweathouses were built into pits excavated in stream banks and covered with a structure

against the bank. The tule raft, propelled by double-bladed paddles, was used to navigate across San Francisco Bay (Kroeber 1970:468).

Mussels were an important staple in the Ohlone diet, as were acorns of the coast live oak, valley oak, tanbark oak, and California black oak. Seeds and berries, roots and grasses, and the meat of deer, elk, grizzly, rabbit, and squirrel formed the Ohlone diet. Careful management of the land through controlled burning served to ensure a plentiful, reliable source of all these foods (Levy 1978:491).

The Ohlone usually cremated a corpse immediately upon death but, if there were no relatives to gather wood for the funeral pyre, interment occurred. Mortuary goods comprised most of the personal belongings of the deceased (Levy 1978:490).

The arrival of the Spanish in 1775 led to a rapid and major reduction in native California populations. Diseases, declining birth rates, and the effects of the mission system served to largely eradicate the aboriginal life ways. Brought into the missions, the surviving Ohlone, along with the Esselen, Yokuts, and Miwok, were transformed from hunters and gatherers into agricultural laborers (Levy 1978; Shoup et al. 1995). Following secularization of the mission system in the 1830s, numerous ranchos were established in the 1840s. Generally, the few Indians who remained were then forced, by necessity, to work on the ranchos.

In the 1990s, some Ohlone groups (e.g., the Muwekma, Amah, and Esselen further south) submitted petitions for federal recognition (Esselen Nation 2007; Muwekma Ohlone Tribe 2007). Many Ohlone are active in preserving and reviving elements of their traditional culture and are active participants in the monitoring and excavation of archaeological sites.

3.4 HISTORICAL SETTING

The historic period in the eastern San Francisco Bay region began with the Fages-Crespi expedition of 1770. The Fages party explored the eastern shore of San Francisco Bay, eventually reaching the location of modern Fremont, where they traded with the local Costanoans. Members of the expedition eventually sighted the entrance to San Francisco Bay from the Oakland Hills. In 1772, a second Fages expedition traveled from Monterey through what are now Milpitas, San Lorenzo, Oakland, and Berkeley, finally reaching Pinole on March 28, 1772 (Cook 1957:131). From there they traveled through the locations of today's Rodeo and Crockett to Martinez, made a brief foray into the delta region of the Central Valley, and then camped somewhere near Pittsburg or Antioch. On March 31, the Fages party began the return journey to Monterey. They traveled to the vicinity of today's Walnut Creek, turned south, and then made their way to the Danville area, where they spent the night. On April 1st, they passed through today's San Ramon, Dublin, and Pleasanton, finally arriving back in the area of Milpitas on the following day.

In 1776, the Anza-Font expedition traveled through the same area and also traded with residents of native villages encountered along the way. The most significant impact of the European presence on the local California natives, however, was not felt until the Spanish missions were established in the region (Cook 1957:132).

In 1775, Captain Juan Manuel Ayala's expedition studied the San Francisco Bay and ventured up the Sacramento and San Joaquin rivers. The first mission in the region was established the following year with the completion of Mission San Francisco de Asis (Mission Dolores) in San Francisco. Mission Santa Clara followed in 1777, and Mission San Jose in 1797. The Mission era lasted approximately 60 years and proved to be the downfall of the native inhabitants of the region, who were brought to the missions to be assimilated into a new culture as well as to provide labor for the missionaries. Diseases introduced by the early explorers and missionaries, and the contagions associated with the forced communal life at the missions

killed a large number of local peoples, while changes in land use made traditional hunting and gathering practices increasingly difficult. Cook (1976) estimates that by 1832, the Costanoan population had been reduced from a high of over 10,000 in 1770 to less than 2,000.

In 1820, Sergeant Luis Maria Peralta received a grant of "10 square leagues" of land in the East Bay in recognition of his long, faithful military service in California. Peralta named his grant Rancho San Antonio. It comprised the land that lay from the water's edge to the crest of the Oakland hills between San Leandro Creek to the south and El Cerrito Creek to the north (Hendry and Bowman 1940), completely encompassing modern-day Oakland, Berkeley, Emeryville, Piedmont, Albany, Alameda, and a portion of San Leandro (Sher 1994:9).

Following the U.S. takeover of Alta California from Mexico in 1848, rancho lands began to be divided up and generally overrun by Anglo immigration to the area that was coincident with the land boom following the Gold Rush of 1849. Rancho San Antonio suffered the fate of most Mexican land grants in northern California, with squatters taking quasi-legal title to lands, and the courts denying title to the original grantees (Hendry and Bowman 1940).

3.4.1 Oakland Historic Context

Early surveyors mapped parts of Oakland just after the time that Peralta's dominance began to give way to recently-settled American interests. The 1856 Survey of the Coast of the United States depicts the area that would become known as downtown and West Oakland. Although streets had been laid out near Broadway, much of the dry land remained covered in groves of oaks and was relatively unpopulated. Marshland extended as far north as modern-day Fifth Street in several locations, and Gibbons Pier, located at the end of Seventh Street, was the only sign of the industry to come. Oakland's early growth was concentrated near the wharves and rail lines that eventually transformed the rural outpost into a transportation center for both passengers and goods.

The first growth period followed the completion of the San Francisco & Oakland Railroad (SF&ORR) along Seventh Street in 1863, connecting Oakland to San Francisco by way of San Jose and enticing real estate speculators who saw the area as ideal for development. Only six years after the local rail connection was completed, the Big Four (Collis Huntington, Leland Stanford, Charles Crocker and Mark Hopkins) made a decision that would shape Oakland's future. The Central Pacific Railroad would locate the western terminus of its transcontinental route at Oakland Point (Scott 1959:48). Buildings were clustered at the foot of Broadway as well as at the end of the alignment of Seventh Street, where wharves extended into the bay. The businesses and residents that would soon fill the area, however, did not yet surround the local and transcontinental rail lines. City streets had been surveyed, although many blocks remained wooded or had become home to only small numbers of people. The large lots characteristic of a more rural settlement pattern were still present, and the northeastern portions of the city were growing far slower than downtown and West Oakland.

By the turn-of-the-century, electric railways connected the most densely populated areas of Oakland to the outlying suburbs. Some previously urban middle-class families now chose a suburban life in the relatively open spaces of the East Bay, and the 1906 earthquake further encouraged some urban residents to relocate to outlying areas.

The Oakland, Antioch & Eastern Railroad (OA&E) was also depicted on the 1915 USGS map along an alignment that ran southeast to northwest, ½-mile east of the Project area. The OA&E, an interurban line, shared the Key system ferry terminal in Oakland and made travel between San Francisco and emerging suburbs and recreation areas easier and more cost efficient. Lines between Oakland and Sacramento were

operational by 1913 and eventually became part of the Sacramento Northern Railroad (Groff 2011; Western Railway Museum 2014).

World War I was a catalyst for the shipyards on the Oakland waterfront, as new workers were enticed to the area by increased economic activity. Beth Bagwell summarized the growth of Oakland's hillside neighborhoods.

After the earthquake, Oakland experienced a housing construction boom; bungalows replaced the remaining hayfields in Rockridge, Claremont, and the district north to the Berkeley border. In the 1920s, the demand continued, spurred by the post-war prosperity and by the opening of new real estate tracts made easily reachable by the automobile. Piedmont, Montclair, Trestle Glen, and the Lakeshore district were among neighborhoods that experienced their greatest growth at this time. In 1923, a graph in the *Oakland Tribune Yearbook* showed a 900 percent increase in the number of dwellings built over the previous five years (Bagwell 1982:200).

Oakland did not escape the consequences of the Great Depression. Although the Southern Pacific Railroad (which merged with the Central Pacific Railroad in 1885) remained solvent, large numbers of jobs were lost. The San Francisco Bay Bridge was constructed between 1933 and 1936 in the midst of the Great Depression, and although it may not have been evident at the time, the bridge would significantly change a community that had built itself around its transportation terminals.

World War II brought a degree of economic relief through another round of increased shipbuilding, and it also saw the construction of the Oakland Army Base and the Naval Supply Center. As the outlying areas of Oakland continued to fill with new immigrants and residents who had left the city center, the oldest areas of downtown struggled, as automobiles and trucks began to dominate the transportation market that had defined Oakland's early growth.

4.0 CULTURAL RESOURCE INVENTORY

On January 24, 2020, Paleowest Archaeologist Zack Babineau conducted a records search at the Northwest Information Center (NWIC), at Sonoma State University, for the Oakland Unified School District Central Administration Center Survey (File No. 19-1233). The records search included a review of cultural resources studies and recorded cultural resources within the Project area and a 1/4-mile radius of the Project area. The records search also included a review of the Office of Historic Preservation's "Directory of Historic Property Data File for Contra Costa County". Paleowest also reviewed the Office of Historic Preservation (OHP) Historic Properties Directory, which includes information regarding National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the list of California State Historical Landmarks, the list of California State Points of Historical Interest, and pertinent historic building surveys. The objective of this records search was to identify any cultural resources that have been previously recorded within the study area during previous cultural resource investigations.

4.1 PREVIOUS CULTURAL RESOURCES REPORTED WITHIN THE STUDY AREA

The records search results indicate that no cultural resources have been previously recorded within the Project area; and a total of 22 cultural resources are located within ¼-mile of the Project areas. These resources are listed below in Table 1.

Table 1: Cultural Resources Within 1/4-mile of the Project Area

Primary Number	Resource Name	Age	Recorder
P-01-005887	Peralta Villa	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-005962	Oakland Point District	Historic	"1989 ([none], Oakland Cultural Heritage Survey); 1990 ([none], Oakland Cultural Heritage Survey); 2003 (Monte Kim, Science Applications International Corp.)"
P-01-006108	Chiesa (Luigi) flats	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006113	Carle (Silas) - Lagorio (A.) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006115	Carle (Silas) - Connolly (Martin) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006117	Hoppe (John) - Fuchs (Philip) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006119	Fuchs (Philip) - Maggio (E&F) flats	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006266	Grist (Wm.H.) garage	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006302	Sandelin (Elias Fred) rental house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006304	Freese (Johanna and Frederick) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006305	Fitzgerald store/flat-Hirota(M) cleaners	Historic	1990 ([none], Oakland Cultural Heritage Survey)

P-01-006306	Boscacci (Pietro) rental house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006307	Schulze (F.) rental-Gereich (E.) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006308	Schirmer (August H.T.) house	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006309	Catera (Luca) store and restaurant	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006310	Wells Fargo-Railway Express wagon shed	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006311	True Light Missionary Baptist	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-006312	Maggio (Elena/Fortunato) rental cottage	Historic	1990 ([none], Oakland Cultural Heritage Survey)
P-01-007810	Haven (Charles D. and Laura) House	Historic	1992 (Staff and Consultants, Oakland Cultural Heritage Survey)
P-01-010509	Mandela-1	Prehistoric	2002 (Dale Beevers and Jason Claiborne, Archeo-Tec)
P-01-010521	Oakland Block 532	Historic	2002 (Thad M. Van Bueren, Caltrans, District 4)
P-01-010522	Oakland Block 533	Historic	2002 (Thad M. Van Bueren, Caltrans, District 4)

All of the cultural resources reported within the ¼-mile buffer of the Project area, excluding P-01-010509, are sites of residential and commercial buildings that date from the late 19th century to the mid-20th century. Resource P-01-010509, or Mandela-1, is a prehistoric deposit site that was found during the construction of the Mandela Gateway project. The prehistoric deposit contained midden comprised of a dense quantity of shell, few faunal fragments, and few charcoal chunks. Archeo-Tech interpreted the site as likely a food processing site associated with an unknown nearby habitation deposit.

4.2 PREVIOUS CULTURAL RESOURCE INVESTIGATIONS

A total of 62 cultural resource studies have been completed for locations within ¼-mile of the Project area. These studies are listed below in Appendix A. These report types include archaeological research, theses and dissertations, architectural/historical evaluations, CHP correspondence reports, management/planning reports, and literature search reports. Only one of these studies, S-037362, cross the Project area.

4.3 ADDITIONAL SOURCES

In addition to the records search, PaleoWest completed a review of the historical topographic maps and historic aerials that depict the Project area. The 1895 and 1899 United States Geologic Survey San Francisco quadrangle maps depict the Project area as having at least three buildings; one on Poplar St that is connected with another on 10th St, and a small isolated structure on Union St (USGS 1895 & 1899). The northern half of the Project area is undeveloped and there is a large vacant lot located on 12th St that spans three blocks from east to west. The 1915 San Francisco map shows at least seven buildings existing within the Project area, two on Poplar St, 1-2 on 10th St, and four on Union (USGS 1915). Twenty-four years later, an aerial from 1939 (Flight C_5750) shows the Project area with only one large building on 10th St. (Cartwright Aerial Surveys 1939). This building is large and U-shaped and is the only constant

building observed on this block on maps and aerial surveys throughout the years. There is no evidence of the vacant lot that was north on 12th St, the area is now heavily developed and is broken into three residential blocks. The 1949 Oakland West map depicts additional structures of the Project area, and the main building on 10th St is titled “Cole School”, which is still there today (USGS 1949). Only ten years later, the 1959 Oakland West map shows Cole School with an additional six structures, three on Union St and three on Poplar St (USGS 1959). In 1965, an aerial (Flight CAS_65_130) depicts the Project area to only have one small shed-like structure adjacent to the main school building, on Union (USGS 1959). The 1973 Oakland West map again shows Cole School with the six structures we saw on the 1959 USGS map (USGS 1973). The 1980 Oakland West map then depicts only two buildings on the Project area block, the main building for Cole School, and a small structure on Poplar St (USGS 1980). The small structure from the 1980 USGS map is currently still there, and no additional structures have been built on the property.

4.4 NATIVE AMERICAN COORDINATION

Paleowest contacted the Native American Heritage Commission (NAHC) on February 7, 2020 with a request for information on sacred sites or tribal cultural resources within the Project area, and for a list of Native American tribal representatives with heritage ties to the county. The NAHC response dated February 10th, stated that and after conducting a record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF), the results were positive; Paleowest was instructed to contact the Amah Mutsun Tribal Band of Mission San Juan Bautista and North Valley Yokuts Tribe for more information. The NAHC response provided a list of Native American contacts (Tony Cerda, Chairperson, Costanoan Rumsen Carmel Tribe; Katherine Perez, Chairperson, North Valley Yokuts Tribe; Irenne Zwierlein, Chairperson, Amah Mutsun Tribal Band of Mission San Juan Bautista; Ann Marie Sayers, Chairperson, Indian Canyon Mutsun Band of Costanoan; Monica Arellano, Chairperson, Muwekma Ohlone Indian Tribe of the SF Bay Area; Andrew Galvan , Chairperson, The Ohlone Indian Tribe; and Corrina Gould, Chairperson, The Confederated Villages of Lisjan).

Paleowest contacted the Native American representatives by email, on February 12, 2020, informing them of the project and asking for any recommendations for the Project. Follow up calls were made on February 18, 2020, all with no response.

5.0 MANAGEMENT RECOMMENDATIONS

As a result of the archaeological review effort, no cultural resources or isolates were identified with the Project area. In order to reduce the impacts of the Project on previously unknown archaeological resources, the following set of management recommendations are proposed.

5.1 SURVEY OF THE PROJECT AREA

PaleoWest recommends that an archaeologist conduct a pedestrian archaeological survey of the Project area after building demolition. This is intended to be an intensive survey of the Project area conducted to meet the requirements of CEQA. The pedestrian survey should be conducted to evaluate potential project impacts to cultural resources. Any newly discovered historic (over 45 years of age) or prehistoric archaeological sites identified during the survey must be recorded, as required, on appropriate Department of Parks and Recreation Primary Record (DPR 523) and associated (e.g., Building-Structure-Object) forms.

5.2 INADVERTENT DISCOVERIES

Should any previously unknown prehistoric resources in any of the Project areas, including but not limited to charcoal, obsidian or chert flakes, grinding bowls, shell fragments, bone, or pockets of dark, friable soils be discovered during grading, trenching, or other on-site excavation(s), earthwork within 25 feet of these materials shall be stopped until a qualified professional archaeologist have an opportunity to evaluate the potential significance of the find and suggest the appropriate steps to protect the resource.

According to CEQA Section 15126.4, avoidance is the preferred mitigation. Since CEQA provisions regarding the preservation of historic resources direct that adverse effects to historic resources shall be avoided, if feasible, the resource shall be protected from damaging effects through avoidance.

If avoidance of any previously undiscovered archaeological site is not feasible, data recovery shall be conducted in accordance with an approved Archaeological Data Recovery Plan (ADRP) to mitigate adverse effects to the significance of the site – the area of data recovery being limited to the area of adverse effect. This would fulfill CEQA requirements that the mitigation measure must be "roughly proportional" to the impacts of the project. A professional, qualified archaeologist shall conduct data recovery in compliance with CEQA Guideline Section §15064.5. Once the site has been properly tested, subject to data recovery, or preserved to the satisfaction of the professional archaeologist in compliance with CEQA Guideline §15064.5, the site can be further developed.

5.3 INADVERTENT DISCOVERY OF HUMAN REMAINS

Ground disturbing activities associated with construction activities in the Project area could disturb previously unknown human remains, including those interred outside of formal cemeteries. The potential to uncover Native American human remains exists in locations throughout California. Although not anticipated, human remains may be identified during site-preparation and grading activities.

Section 7050.5(b) of the California Health and Safety code will be implemented in the event that human remains, or possible human remains, are located during Project-related construction excavation. Section 7050.5(b) states:

> In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code.

The County Coroner, upon recognizing the remains as being of Native American origin, is responsible to contact the NAHC within 24 hours. The Commission has various powers and duties, including the appointment of a Most Likely Descendant (MLD) to the Project. The MLD, or in lieu of the MLD, the NAHC, has the responsibility to provide guidance as to the ultimate disposition of any Native American remains.

CA-CHPS 2014 Editions, Annotated Worksheet prepared for the Administrative Building at Cole Project

Shaw Kawasaki Architects, February 19, 2021

CA-CHPS 2014 EDITION v1.02 - ANNOTATED SCORECARD

Project Information from Project Summary		Review Information	
Project Name:	CENTRAL ADMINISTRATIVE CENTER AT COLE CAMPUS	Submission/Resubmission Date:	5/26/2020
Project Location:	1011 Union Street, Oakland, CA 94607	Review Completed Date:	For Admin Use Only
Project Type:	Non-Classroom Building	CHPS Project ID:	For Admin Use Only

Instructions: Enter the submission or resubmission date and complete 'Points Pursued' columns. Columns entitled 'References for Contractors and Team (Attachments, Construction Docs, etc.)' and 'Other Notes for Contractor Regarding Compliance'are optional but encouraged to communicate project requirements to other team members. Use the Documentation tabs to list full references and attachments for formal review. This document is intended to assist in communicating important information to contractors and to facilitate review of the project by CHPS. This sheet is formatted to print on a 30"x 42" plan sheet.

	Criteria		Prerequisite	CalGreen/ Title 24 Measures	Points Possible	Points Pursued	References for Contractors and Team (Attachments, Construction Docs, etc.)	Other Notes for Contractor Regarding Compliance (Items to track during construction, etc.)
Integration		**Subtotal**			**20**	**4**		
II 1.0	Integrated Design		P	T	1	1	Min 2 CHPS workshops	
II 1.1	Enhanced Integrated Design				1	1	Involve GC before CDs, or more workshops, or use BIM	
II 2.1	District Level Commitment				2	1	Only 1 point possible in NC. OUSD is CHPS member and mandates CHPS best practices	
II 3.1	School Master Plan				1	0	N/A	
II 4.1	High Performance Transition Plan - MOD				2	0	N/A for new construction	
II 5.0	Educational Display		P		1	1	Provide a permanent display that describes the high performance features	
II 6.1	Educational Integration				2	0	Involve students as CHPS champions, prepare sustainability education (min 10hrs/yr), educational displays...	
II 7.1	Demonstration Area				1	0	Interactive feachtures for each one of the 5 major env categories: Indoor Environmental Quality, Energy, Water, Site, and Materials and Waste Management.	
II 8.1	Climate Change Action / Carbon Footprint Reporting				3	0	Calculate GHG Inventory (scopes 1, 2 & 3)	
II 9.1	Crime Prevention Through Environmental Design				1	0	Incorporate in design the CPTED Principles: natural surveillance, natural access control, territorial reinforcement, maintenance and management	
II 10.1	Innovation (CHPS Verified Projects only)				4		2 pts per strategy, max 2 strategies. TBD if needed	
II 11.1	District-Wide Sustainability Planning				1	0	SKA: cannot attempt this point since we are not pursuing 8.1.2 Climate Change Action point	
Indoor Environmental Quality		**Subtotal**			**82**	**37**		
EQ 1.0	HVAC Design - ASHRAE 62.1		P	C/T	8	8	MEP Eng	
EQ 1.1	Enhanced Filtration				2		Min MERV 15	
EQ 1.2	Dedicated Outdoor Air System				3		Provide a dedicated outdoor air ventilation system with the ability to efficiently process and manage ventilation down to the individual room level	
EQ 2.1	Pollutant and Chemical Source Control				2	1	3 strategies below=1 point, 5 strategies =2 points. Strategies: off-gassing; walk-off mats; electric ignitions for gas-fired equipment; no mobile fossil-fuel powered equipment indoors (polishers, etc.); CO monitoring, electronics meeting EPEAT rating	
EQ 3.0	Outdoor Moisture Management - NEW		P	C	1	1	CALGreen Section 5.407	
EQ 3.1	Outdoor Moisture Management - MOD					0	N/A for new construction	
EQ 4.1	Ducted Returns				2		Regularly occupied spaces with ducted HVAC return to minimize dust and microbial growth	
EQ 5.0	Construction Indoor Air Quality Management		P	C	7	7	GC to follow SMACNA guidelines for new construction. AND flushout	
EQ 5.1	Enhanced Construction Indoor Air Quality Management				1	2	2 points allowed in non-classroom bldg. Dust control, and follow SMACNA guidelines for occupied bldgs during construction	
EQ 6.1	Post-Construction Indoor Air Quality				1	1	Specify daily cleaning with certified HEPA filter vacuum that meets or exceeds the CRI Seal of Approval/Green Label Vacuum Cleaner Program	
EQ 7.0	Low Emitting Materials		P	C	2	2	Meet CALGreen in paints-coatings, flooring, composite wood, adhesives-sealants-caulks	
EQ 7.1	Additional Low Emitting Materials				6	3	1 pt each: paints-coatings, flooring, composite wood, adhesives-sealants-caulks, furniture-furnishings, ceilings-walls	
EQ 8.1	Low Radon				1	0	Measure radon and mitigate if radon concentrations > 4 pCi/L.	
EQ 9.0	Thermal Comfort - ASHRAE 55		P		4	4	Meet ASHRAE Standard 55 for thermal comfort standards	
EQ 10.1	Individual Controllability				2	0	Intended for classrooms but can translate to NC buildings depending on room type.	
EQ 10.2	Controllability of Systems				2	0	Intended for classrooms but can translate to NC buildings depending on room type. Enable teachers to have reasonable thermal control. Tstat in each classroom and 90% of classrooms with at least 1 operable window	
EQ 11.0	Daylighting: Glare Protection		P	T	4	4	Minimize glare and direct sunlight penetration	
EQ 11.1	Daylight Availability				7	2	Only 2 points available in non-classroom bldg. Support spaces option is applicable only. Daylighting controls and min 30fc illuminance for 50% of adm area and over 40fc in common areas	
EQ 12.1	Views				3	1	Focused on classrooms, libraries, and admin areas but can translate to other room types. Direct line of sight to view glazing from regularly occupied spaces	
EQ 13.1	Electric Lighting Performance				2	0	Credit is focused on classrooms only but practices not limited to classrooms. Project could consider Innovation points	
EQ 13.2	Superior Electric Lighting Performance				7	0	Credit is focused on classrooms only but practices not limited to classrooms. Project could consider Innovation points	
EQ 14.0	Acoustical Performance		P	C	5	0	Applies to classrooms only. N/A for our administration building. Confirmed by Elisabeth Krautscheid (ekrautscheid@chps.net) on 3/31/20 by email	
EQ 14.1	Enhanced Acoustical Performance				4	0	SKA response: we will not pursue this point. Not within acoustical consultant's scope.	
EQ 15.1	Low-EMF Wiring				1		No net current magnetic fields – Correct wiring	
EQ 15.2	Low-EMF Best Practices				2		Most of this is geared for classrooms but other room types with similar equipment could pursue some practices.	
EQ 16.1	Thermal Displacement Ventilation				2	0	N/A. Applies to classrooms only	
EQ 17.1	Mercury Reduction				1	1	All LED lighting	
Energy		**Subtotal**			69	27		
EE 1.0	Energy Performance		P	T	8	8	Time dependent valued (TDV) energy must be at least 5% less than Title 26-Part 6-2016	
EE 1.1	Superior Energy Performance				40	6	Utilize the Energy EE 1.0 for quantifying reductions in total energy use. 5% 3 pts. 10% 6pts, 15% 9 pts, 20% 12 pts, 30% 18 pts, 40% 22 pts, 50% 25 pts, 60% 28 pts, 70% 31 pts, 80% 34 pts, 90% 37 pts, 100% 40 pts	Interface Bldg Performance Report dated April 14, 2020 confirms compliance margin of 10.1% (6 pts)
EE 2.0	Solar Ready - NEW		P	T	0	0	Title 24, Part 6, Section 110.10	
EE 2.1	Zero Net Energy Bonus				2	2	Zero Net-Energy Capable	
EE 3.0	Commissioning		P	T	4	4	Like LEED enhanced Cx. Requires 3rd party CxA and 10-month post occupancy review	
EE 3.1	Additional Commissioning Qualifications				1	1	CxA is is a licensed architect or engineer with at least two years' experience in the state	
EE 3.2	Building Envelope Commissioning				2	0	Usually specialty consultant	
EE 4.0	Environmentally Preferable Refrigerants - NEW		P	C	1	1	No CFCs or Halons	
EE 4.1	Environmentally Preferable Refrigerants - MOD					0	N/A for new construction	
EE 5.0	Energy Management System - NEW		P	T	0	0	Comply with Title 24 Energy Management Systems (EMS), lighting control and metering	
EE 5.1	Energy Management System				2	0	N/A for new construction	
EE 5.2	Advanced Energy Management System and Submetering				2	2	Automated Demand Management and install a meter data acquisition and storage system for all electrical power used within the building	
EE 6.1	Natural Ventilation			T	3	0	N/A if there'sr mechanical air-cooling	
EE 7.1	Low Carbon School				1	1	Do not use on-site natural gas consumption for space heating and water heating	
EE 8.1	Electric Vehicle Charging				1	0	EV chargers in 2% of parking spaces. There will only be EV-ready	
EE 9.0	Energy Conservation Interlocks - NEW		P	T	2	2	Install interlocks on doors and windows as required in Title 24 Section 140.4(n)	
EE 9.1	Energy Conservation Interlocks - MOD					0	N/A for new construction	

	Criteria		Pre- requisite	CalGreen Element	Points Possible	Points Pursued	References for Contractors and Team (Attachments, Construction Docs, etc.)	Other Notes for Contractor Regarding Compliance (Items to track during construction, etc.)
Water		**Subtotal**			22	13		
WE 1.0	Indoor Water Use - NEW		P	C	4	4	Comply with CALGreen, Sections 5.303.3 and 5.303.6	
WE 1.1	Minimum Reduction in Indoor Potable Water Use - MOD					0	N/A in new construction	
WE 2.1	Reduce Potable Water Use for Sewage Conveyance				4	2	Only 2 pts available in non-classroom bldg. Reduce water use at least 20%	
WE 3.0	Irrigation and Exterior Water Budget		P	C	1	1	CALGreen mandatory measure SKA: confirmed by Landscape that we will meet this requirement	
WE 3.1	Irrigation and Exterior Water Budget - Use Reduction				2	0	Irrigation with soil moisture meter and auto shut-off SKA: confirmed by Landscape we cannot pursue this point as it pertains to recreational playing fields	
WE 4.1	Reduce Potable Water Use for Non-Recreational Landscaping				3	1	Reduce water use for irrigation. 20% 1 pt, 30% 2 pts, 50% 3 pts SKA: confirmed by Landscape we can achieve 20% reduction in potable water use	
WE 5.1	Reduce Potable Water Use for Recreational Landscaping				2	0	N/A	
WE 6.1	Irrigation Systems Commissioning				3	3	Ensure it is included in Cx scope, as usual	
WE 7.1	Water Management System				2	2	Sub meter indoor water uses & landscaping	
WE 8.1	Demonstration Rainwater Catchment				1	0	Rainwater catchment must be exposed and with permanent signage for education	
Sites		**Subtotal**			23	15		
SS 1.0	Site Selection		P		2	2	Do not build on sites containing pollutants known to be hazardous to student and staff health. CEQA document might have the info	
SS 2.1	Environmentally Sensitive Land				2	2	Previously developed	
SS 3.1	Minimize Site Disturbance				1	0	Floor Area Ratio OK: 56,176/110,759=1.9 (over 1.4) Parking capacity- no add compared to existing conditions & 5% preferred for carpools/vanpools and low emitting vehicles. SKA: Cannot achieve this point because requires 25% of site area to be vegetated open space, which is more than what we have shown.	
SS 4.0	Construction Site Runoff Control and Sedimentation		P		1	1	GC to do	
SS 5.0	Grading and Paving - NEW		P	C	0	0	Comply with CALGreen Section 5.106.10	
SS 5.1	Post Construction Stormwater Management				2	2	Reduce 25% stormwater runoff compared to pre-development AND isolate trash area to prevent off-site transport of trash. AND provide post-construction BMPs Civil to advise SKA: Civil has confirmed these 2 points are achievable	
SS 6.1	Central Location				2	2	Site within 1/2 mile of 8 basic services	
SS 7.1	Located Near Public Transportation				1	1	Site within 1/4 mile of a commuter rail, light rail or subway station, or within 1/8 mile of one bus line.	
SS 8.1	Joint Use of Facilities				1	0	50% of parking for community, all available off hours. 75% of garden space for community	
SS 9.0	Bicycle Parking - NEW		P	C	0	0	Comply with CALGreen, Section 5.160.4.2.2.	
SS 9.1	Human-Powered Transportation				2	1	Walkways and bike lanes from building entrace to end of property, AND bike parking (% based on number of students. 5 to 25%, not clear)	
SS 10.1	Reduce Heat Islands - Landscaping and Sites				2	0	Site non-roof area: 50% impervious, or with shade, or SRI over 0.29 SKA: per Civil we could potentially achieve these points but will add cost. Since budget is a concern and we don't need extra points, we will not pursue this.	
SS 11.1	Reduce Heat Islands - Cool Roofs and Green Roofs/Walls				2	2	SRI over 82 in at least 75% of roof surface	
SS 12.0	Light Pollution Reduction - NEW		P	C	0	0	CALGreen mandatory measure. Required only within scope of project.	
SS 12.1	Avoid Light Pollution and Unnecessary Lighting				2	1	Lighting eng to advise. Controls, lumens per acre, CRI...	
SS 13.1	School Gardens				2	0	Provide a min of 200sf of garden for a student enrollment of 499 or less to promote learning about environment and healthy foods	
SS 14.1	Use Locally Native Plants for Landscape				1	1	At least 80% of plants are native species	
Materials and Waste Management		**Subtotal**			17	12		
MW 1.0	Storage and Collection of Recyclables		P	C	2	2	Minimum: paper, cardboard, glass, plastics, organic waste, and metals. The school must have a written program stating the logistics of the recycling efforts.	
MW 2.0	Construction Site Waste Management		P	C	2	2	Min 65%	
MW 2.1	Construction Site Waste Management				2	1	75% diversion = 1 pt 90% diversion = 2pts	
MW 3.1	Single Attribute - Recycled Content				2	2	Specify materials with recycled. At least 20% by cost	
MW 4.1	Single Attribute - Rapidly Renewable Materials				1	1	Specify rapidly renewable materials for 50% by area of one of these: flooring, casework, acoustic ceiling tile, wall covering	
MW 5.1	Single Attribute - Certified Wood				1	1	50% of wood FSC certified	
MW 6.1	Single Attribute - Materials Reuse				1	0	N/A in non-classroom bldg	
MW 7.1	Multi-Attribute Materials Selection				2	2	Select at least 10 products with EPDs	
MW 8.1	Building Reuse - Exterior - MOD				2	0	N/A for new construction	
MW 9.1	Building Reuse - Interior - MOD				1	0	N/A for new construction	
MW 10.1	Health Product Related Information Reporting				1	1	At least 20 products with HPD, C2C, MHC, Declare or GreenScreen	
Operations & Metrics		**Subtotal**			17	4		
OM 1.0	Facility Staff and Occupant Training		P		2	2	Shall be in CxA scope	
OM 2.1	Post-Occupancy Transition				1		Do post-occupancy meeting and survey	
OM 3.0	Performance Benchmarking		P		2	2	Policy: track energy use over time: Conduct a post-occupancy analysis of the school's indoor environmental quality, and energy performance after 1-2 years or perform recommissioning after 2-5 years.	
OM 4.1	High Performance Operations				6	0	Only 2 possible points in non-classroom bldg. 4.1.1 intended for classrooms.	
OM 5.1	Systems Maintenance Plan				1		Create a school Systems Maintenance Plan for MEP items	
OM 6.1	Indoor Environmental Management Plan				1		Employ during operations the EPA's IAQ Tools for Schools Action Kit: www.epa.gov/iaq/schools/actionkit.html	
OM 7.1	Green Cleaning				1		Owner to decide. Create plan and audit between 12-18 months from occupancy	
OM 8.1	Integrated Pest Management				1		Design to limit potential of pest (see guidelines). Develop and support an Integrated Pest Management (IPM) Plan that emphasizes a least-toxic approach to IPM.	
OM 9.0	Anti-Idling Measures		P		0	0	No vehicle engines within 100 feet of a school. No idling for more than 30 seconds	
OM 9.1	Additional Anti-Idling Measures				1		Policy and signage	
OM 10.1	Green Power				1		Buy Renewable Energy Certificates (RECs) equivalent to at least 15% of the school's projected annual electricity needs as modeled under EE 1.0 and EE 1.1 for at least two years of occupancy.

Attention: Mr. Tadashi Nakadegawa, Acting Executive Director

Subject: ***Response to CGS Review Comments***
Cole Campus – Central Administrative Center
1011 Union Street, Oakland, California 94607
CEL Project No. 84-04726-B

References:
1) *"Geotechnical Engineering and Geologic Hazards Study, Cole Campus – Central Administrative Center,"* CEL Project No. 84-04726-PWA, dated May 22, 2020.
2) *"Engineering Geology and Seismology Review for Central Administrative Center at Cole Campus – New Buildings, CGS Application No. 01-CGS4511,"* dated September 10, 2020.

Dear Mr. Nakadegawa,

Consolidated Engineering Laboratories (CEL) has prepared this response letter to address review comments issued by the California Geological Survey (CGS) to the Oakland Unified School District (District) regarding the proposed new Central Administrative Center at Cole Campus in Oakland. CEL previously prepared and submitted the referenced geotechnical report for this project (Reference 1).

Following their review of our report, CGS (Reference 2) requested CEL revise our site-specific ground motion analysis to include the possibility of rupture of all the segments of the Hayward Fault, and provide updated site-specific ground motion parameters, design response spectrum, and PGA_M. Based on the resulting analysis results, CGS also requested CEL to revise the liquefaction analyses, as needed.

As recommended by CGS, we revised our May 22, 2020 geotechnical engineering and geologic hazards study report, which is attached. As presented in our revised report, Section *6.2.2 Deterministic (MCE_R) Ground Motions*, our site-specific ground motion analysis was revised to include all segments of the Hayward Fault: HN+HN+HS. The results of the analysis are presented in Section 6.2 of our revised report.

Using the resultant PGA_M from our revised site-specific ground motion analysis, we have updated our liquefaction analysis and the results are presented in the table below, as well as in our revised report. Our revised analysis shows that the calculated total seismically-induced settlements have increased slightly (< 0.1 inch); however, it remains our judgment that the calculated values of potential liquefaction settlement would not result in significant surface manifestation of such liquefaction settlement, and that significant post-seismic reduction in the bearing capacities of the existing overlying soils would not occur. In our opinion, the proposed project site is still suitable for a shallow foundation system as recommended in our report.

Seismic Settlement Analysis Results

CPT No.	Calculated Liquefaction Settlement (inches)	Calculated Dynamic Compaction Settlement (inches)	Calculated Total Seismic Settlement (inches)
CPT-1	0.34	0.08	0.42
CPT-2	0.62	0.10	0.72
CPT-3	0.66	0.02	0.68
CPT-4	0.53	0.04	0.57

Closing

We trust that this letter provides the requested information at this time. If you have any questions regarding the contents of this letter, please contact Mr. Dare via email (cdare@ce-labs.com). We greatly appreciate the opportunity to be of service to the District and to be involved in the design of this project.

Sincerely,

CEL Project No. 84-04726-PWA

Dear Mr. Nakadegawa:

Consolidated Engineering Laboratories has completed a Geotechnical Engineering and Geologic Hazards Study for the proposed new Central Administrative Center project to be located at Cole Campus in Oakland, California. This report has been prepared in accordance with the requirements set forth in California Geological Survey Note 48. Transmitted herewith are the results of our findings, conclusions, and recommendations for foundations, interior and exterior concrete slabs, site preparation, grading, drainage, utility trench backfilling, and pavements. In general, the proposed improvements at the site are considered to be geotechnically feasible provided the recommendations of this report are implemented in the design and construction of the project.

Should you or members of the design team have questions or need additional information, please contact any of the undersigned at (925) 314-7100, or by e-mail at cdare@ce-labs.com. We greatly appreciate the opportunity to be of service to the Oakland Unified School District and to be involved in the design of this project.

Sincerely,

1.0 INTRODUCTION

1.1 Purpose and Scope

The purposes of this study were to evaluate the subsurface conditions at the site and prepare geotechnical and geological recommendations for the proposed improvements. This study provides recommendations for foundations, interior and exterior concrete slabs, site preparation, grading, drainage, and utility trench backfilling. This study was performed in accordance with the scope of work outlined in our proposal dated September 11, 2019 and our Contract Amendment request dated February 19, 2020, which included additional services to cover revisions to the originally proposed project.

The scope of this study included the review of pertinent published and unpublished documents related to the site, the drilling of five subsurface borings, four Cone Penetration Tests (CPT), laboratory testing of selected samples retrieved from the borings, engineering analysis of the accumulated data, and preparation of this report. The conclusions and recommendations presented in this report are based on the data acquired and analyzed during this study, and on prudent engineering judgment and experience. This study did not include an assessment of potentially toxic or hazardous materials that may be present on or beneath the site.

1.2 Site Description

Cole Campus is located at 1011 Union Street in Oakland, California, as shown on Plate 1, *Site Vicinity Map*. The project site is located at approximately 37.8082° north latitude and 122.2897° west longitude.

The school site is bounded by 10th Street on the south, Poplar Street on the west, Wade Johnson Park on the north, and Union Street on the south. The proposed Main Building is to be located adjacent to Poplar Street, adjacent to the north side of an existing one-story, former school building. A Multi-Purpose Room (MPR) building is also proposed in the northeast corner of the site.

The property is essentially level, with site elevations ranging between about +15 and +17, based on a revised survey plan prepared by Martin M. Ron Associates dated November 22, 2019 (Oakland City Datum). The school site is occupied by a U-shaped, two-story former school building on the southern portion of the property, the aforementioned one-story former school building adjacent to the northwest corner of the two-story building, a relocatable building on the northeast corner of the site and paved parking and play yard areas on the east and north sides of the property. We understand the southern Main Building is currently used as offices for the OUSD Police Department.

1.3 Proposed Development

Based on our understanding, the project will primarily consist of construction of a new 2-story, 54,000 square-foot office building on the northwest corner of the campus and a single-story, 4,000 square foot MPR building as well as redevelopment of the rest of the property. The project area is currently partially occupied by an existing Main Building, a smaller Cafeteria Building, a relocatable building, a playground, and a parking lot. Project construction will consist of four distinct phases: Demolition of the existing Cafeteria Building, construction of the New Main and MPR Buildings, demolition of the existing Main Building, and site redevelopment consisting of a new parking lot, and other site amenities. Construction of the new buildings will require the removal of current existing AC pavement. The approximate locations of the proposed new office and MPR buildings are shown on Plate 2a, *Site Plan*. A detailed schematic drawing of the proposed development is shown on Plate 2b, *Development Plan*.

1.4 Validity of Report

This report is valid for three years after publication. If construction begins after this time period, CEL should be contacted to confirm that the site conditions have not changed significantly. If the proposed development differs considerably from that described above, CEL should be notified to determine if additional recommendations are required. Additionally, if CEL is not involved during the geotechnical aspects of construction, this report may become wholly or in part invalid; CEL's geotechnical personnel should be retained to verify that the subsurface conditions anticipated when preparing this report are similar to the subsurface conditions revealed during construction. CEL's involvement should include grading and foundation plan review, grading observation and testing, foundation excavation observation, testing of subgrade and baserock preparation in new hardscape and pavement areas, asphalt concrete pavement placement, and utility trench backfill testing.

2.0 PROCEDURES AND RESULTS

2.1 Literature Review

Pertinent geologic and geotechnical literature pertaining to the site area were reviewed. These included various publications and maps issued by the United States Geological Survey (USGS), California Geological Survey (CGS), United States Department of Agriculture (USDA), Federal Emergency Management Agency (FEMA), water agencies, and other government agencies, as listed in the *References* section.

2.2 Field Exploration

In order to characterize the subsurface conditions beneath the proposed improvement areas, a field exploration program was conducted at the site on November 9, 2019 and May 2, 2020 under the supervision of a California-certified geotechnical engineer. The borings were sited to satisfy CGS Note 48 requirements and to facilitate development of soil cross section profiles across the area of the subject project. Our field exploration program consisted of performing a combination of drilled test borings and Cone Penetration Tests (CPT). A total of five test borings were drilled and four CPTs were advanced at the locations shown on Plates 2a and 2b. The borings supplement two borings previously drilled at the site by CEL's geotechnical affiliate, Geosphere Consultants, Inc., in 2015.

2.2.1 Test Borings

The new borings, designated B-1 through B-4, and B-5, were drilled using a truck-mounted B-53R and B-61 drill rig equipped with eight-inch hollow stem augers, respectively. Following the completion of drilling, the boreholes were backfilled using a cement grout in accordance with Alameda County Public Works Agency (ACPWA) drilling permit requirements.

A CEL representative visually classified the materials encountered in the borings according to the Unified Soil Classification System as the borings were advanced. Relatively undisturbed soil samples were recovered at selected intervals using a three-inch outside diameter Modified California split spoon sampler containing six-inch long brass liners, and a two-inch outside diameter Standard Penetration Test (SPT) sampler. The samplers were driven by means of a 140-pound wireline hammer with an approximate 30-inch fall using a manually operated lever-drop mechanism. Resistance to penetration was recorded as the number of hammer blows required to drive the sampler the final foot of an 18-inch drive. All of the field blow counts recorded using Modified California (MC)

split spoon sampler were converted in the final logs to equivalent SPT blow counts using appropriate modification factors suggested by Burmister (1948), i.e., a factor of 0.65 with inner diameter of 2.5 inches. Therefore, all blow counts shown on the final boring logs are either directly measured (SPT sampler) or equivalent SPT (MC sampler) blow counts.

The boring logs with descriptions of the various materials encountered in each boring, a key to the boring symbols, and select laboratory test results are included in Appendix A, which also includes previous Geosphere boring logs. Ground surface elevations indicated on the soil boring logs were estimated to the nearest foot using a survey produced by Martin M. Ron Associates.

2.2.2 Cone Penetration Tests (CPTs)

Four CPTs, designated CPT-1 through CPT-4, were conducted on November 9, 2019 to practical refusal depths of 26 to 29 feet. The CPTs were conducted by Middle Earth Geo Testing, Inc. (MEGT) of Orange, California using a truck-mounted, 25-ton cone apparatus. The instrumented cone assembly used for this project included a cone tip with a 60-degree apex, diameter of 44.45 millimeters (mm), and a projected cross sectional area of 15 square centimeters (cm^2), a sleeve segment with a surface area of 225 cm^2, and a pore pressure transducer near the base (shoulder) of the cone tip.

Prior to the start of the test, the truck was jacked up and leveled on four pads to provide a stable reaction for the cone thrust. During the test, the instrumented cone was hydraulically pushed into the ground at a rate of about 20 millimeters per second (about four feet per minute), and continuous readings of cone tip resistance, sleeve friction, and pore pressure were digitally recorded. As the cone advanced, additional cone rods were added. The PC-based data acquisition hardware received electric signals from strain gauges mounted in the cone assembly, and generated graphical logs including cone resistance, friction resistance, friction ratio, and pore pressure ratio versus depth. Pore pressure dissipation tests and shear wave velocity measurements were also performed on select CPTs.

CPT data was subsequently processed based on generally accepted soil behavior type correlations (e.g., Robertson et al., 1986) to interpret soil classification and other properties such as SPT N-value and undrained shear strength were also estimated through correlations. CPT test summaries and plots for all of the CPTs are also presented in Appendix A.

2.3 Laboratory Testing

Laboratory tests were performed on select samples to determine some of the physical and engineering properties of the subsurface soils. The results of the laboratory testing are either presented on the boring logs, and/or are included in Appendix B. The following soil tests were performed for this study:

Dry Density and Moisture Content (ASTM D2216 and ASTM 2937) – In-situ dry density and/or moisture tests were conducted on select samples to measure the in-place dry density and moisture content of the subsurface materials. These properties provide information for evaluating the physical characteristics of the subsurface soils. Test results are shown on the boring logs.

Atterberg Limits (ASTM D4318 and CT204) – An Atterberg Limits test was performed on one sample of cohesive soils encountered at the site. Liquid Limit, Plastic Limit, and Plasticity Index are useful in the classification and characterization of the engineering properties of soil, and help to evaluate the expansive characteristics of the soil and determine the USCS soil classification. Test results are presented in Appendix B, and on the boring logs.

Particle Size Analysis (Wet and Dry Sieve) (ASTM D422, D1140, and CT202) - Sieve analysis testing was conducted on select samples to measure the soil particle size distribution and the total percentage of fines (i.e., percent passing the USCS No. 200 sieve). This information is useful for characterizing the soil type according to USCS, and to assist in the evaluation of liquefaction susceptibility of granular soils or soils of relatively low cohesion. Test results are presented in Appendix B.

Direct Shear (modified ASTM D3080) - Direct shear testing was performed on two samples of onsite soil materials to measure the angle of internal friction and cohesion of the tested material. This data can be utilized in developing allowable bearing capacities, retaining wall design parameters, and strength characteristics of the materials. Direct shear specimens were wetted to near saturation and consolidated under 1,000, 3,000 and 5,000 psf normal loads prior to and during testing. Test results are presented in Appendix B.

R-Value Test (ASTM D2844 and CT301) – One R-value test was conducted on a bulk sample of near-surface material collected from cuttings generated from Boring B-1 to provide data on prospective pavement subgrade materials for use in new pavement section design. Test results are presented in Section 6.8 and in Appendix B.

Soil Corrosivity, Redox (ASTM D1498), pH (ASTM D4972), Resistivity (ASTM G57), Chloride (ASTM D4327), and Sulfate (ASTM D4327) - Soil corrosivity testing was performed to determine the effects of constituents in the soil on buried steel and concrete. Water-soluble sulfate testing is required by the CBC and IBC. Test results are presented in Appendix B and discussed in Section 4.3.

3.0 GEOLOGIC AND SEISMIC OVERVIEW

3.1 Geologic Setting

The site is located in the central portion of the Coast Ranges geomorphic province of California. The Coast Ranges extend from the Transverse Ranges in southern California to the Oregon border and are comprised of a northwest-trending series of mountain ranges and intervening valleys that reflect the overall structural grain of the province. The ranges consist of a variably thick veneer of Cenozoic volcanic and sedimentary deposits overlying Mesozoic sedimentary, metamorphic, and basic igneous Franciscan Assemblage and marine sedimentary rocks of the Great Valley Sequence. The sedimentary rocks of the Coast Ranges are flanked on the east by sedimentary rocks of the Great Valley geomorphic province (Page, 1966).

More specifically, the project site is located in the flatlands west of the base of the Oakland Hills, which is proximal to the San Francisco Bay structural depression to the west. According to Radbruch (1957), the site is underlain by Pleistocene-epoch Merritt sand, consisting of beach or near-shore deposits of slightly clayey, silty sand, the approximate extent of which is shown on Plate 3, *Regional Geologic Map*. Geologic maps by Graymer (2000, 2006), show the site to be underlain by Quaternary-age Beach and dune sand deposits. Bedrock underlying the Oakland-San Leandro area and exposed in the hills to the east primarily consists of gabbro and basalt of the Jurassic Coast Range Ophiolite, Late Jurassic-Early Cretaceous Franciscan rocks, Jurassic silicic volcanics (keratophyre; e.g., Leona Rhyolite) and Late Jurassic-Early Cretaceous Knoxville Formation, as described in Graymer (2000) and CGS (2003). According to the USDA Natural Resources Conservation Service, Web Soil Survey, the site soil is classified as Urban Land - Baywood Eolian deposits generally described as loamy sand.

3.2 Geologic Evolution of the Northern Coast Ranges

The subject site is located within the tectonically active and geologically complex northern Coast Ranges, which have been shaped by continuous deformation resulting from tectonic plate convergence (subduction) beginning in the Jurassic period (about 145 million years ago). Eastward thrusting of the oceanic plate beneath the continental plate resulted in the accretion of materials onto the continental plate. These accreted materials now largely comprise the Coast Ranges. The dominant tectonic structures formed during this time include generally east-dipping thrust and reverse faults.

Beginning in the Cenozoic time period (about 25 to 30 million years ago), the tectonics along the California coast changed to a transpressional regime and right-lateral strike-slip displacements as well as thrusting were

superimposed on the earlier structures resulting in the formation of northwest-trending, near-vertical faults comprising the San Andreas Fault System. The northern Coast Ranges were segmented into a series of tectonic blocks separated by major faults including the San Andreas, Hayward, and Calaveras. The project site is situated between the active Hayward and San Andreas faults, but no known active faults with Holocene movement (i.e., last 11,000 years) lie within the limits of the site. The site is not mapped within an Alquist-Priolo Earthquake Fault Zone.

3.3 Regional Faulting and Tectonics

Regional transpression has caused uplift and folding of the bedrock units within the Coast Ranges. This structural deformation occurred during periods of tectonic activity that began in the Miocene and continues today. The site is located in a seismically active region that has experienced periodic, large magnitude earthquakes during historic times. This seismic activity appears to be largely controlled by displacement between the Pacific and North American crustal plates, separated by the San Andreas Fault zone located approximately 14.5 miles southwest of the site. This plate displacement produced regional strain that is concentrated along major faults of the San Andreas Fault System including the San Andreas, Hayward, and Calaveras faults in this area.

The site is located in a seismically active region dominated by major faults of the San Andreas Fault System. Major active faults include the aforementioned San Andreas Fault; the Hayward Fault, located approximately 4 miles northeast of the site; the Calaveras Fault, located on the order of 14 miles northeast of the site; the Concord-Green Valley Fault, located on the order of 18 miles northeast of the site and the San Gregorio Fault, estimated to be on the order of 23 miles southwest of the site. The site location relative to active and potentially active faults in the San Francisco Bay Area is shown on Plate 4, *Regional Fault Map*. A discussion of the four nearest active faults to the site follows.

3.3.1 Hayward Fault

The Hayward Fault trends northwesterly approximately 88 km from the Milpitas area to San Pablo Bay. The Hayward Fault has been divided into two main segments, the Northern and Southern segments. The Rodgers Creek Fault, considered as a possible extension of the Hayward Fault, extends northward from beneath San Pablo Bay up to near Healdsburg, where it is aligned with the Healdsburg Fault zone (Watt, et al., 2016). The site is located approximately 4.2 miles southwest of the northern segment of the Hayward Fault. The slip rate on this segment of the Hayward Fault is estimated to be about 9 mm/year and has been assigned a moment magnitude

(M_{max}) of 6.4 (CGS, 2003). UCERF3, the earthquake forecast model developed by the Working Group on California Earthquake Probabilities (USGS, 2015) has estimated that there is a 14.3 percent probability of at least one magnitude 6.7 or greater earthquake before 2044 along the Hayward Fault.

3.3.2 San Andreas Fault

The northwest-trending San Andreas Fault runs along the western coast of California extending on the order of 625 miles from the north near Point Arena to the Salton Sea area in southern California (Jennings, 1994). The fault zone has been divided into 11 segments. The site is located about 14½ miles to the northeast of the Peninsula segment. The slip rate on the Peninsula segment of the San Andreas Fault is estimated to be about 17 mm/year and has been assigned a moment magnitude (M_{max}) of 7.1 (CGS, 2003). UCERF3 has estimated that there is a 6.4 percent probability of at least one magnitude 6.7 or greater earthquake before 2044 along the Northern San Andreas Fault.

3.3.3 Calaveras Fault

The Calaveras Fault trends northwesterly about 123 km in length from near Hollister to the San Ramon/Dublin area. The Calaveras Fault has been divided into three segments, the Northern, Central, and Southern segments. The site is located approximately 14 miles southwest of the northern segment of the Calaveras Fault. The slip rate on the north segment of the Calaveras Fault is estimated to be about 6 mm/year and has been assigned a moment magnitude (M_{max}) of 6.8 (CGS, 2003). UCRF3 has estimated that there is a 7.4 percent probability of at least one magnitude 6.7 or greater earthquake before 2044 along the Calaveras Fault.

3.3.4 Concord - Green Valley Fault

The north to northwest trending Concord Fault extends from the approximate central Walnut Creek and Concord border, northward into the Green Valley Fault. The Green Valley Fault extends northward from Suisun Bay up to just west of Lake Curry, northeast of Napa. The site is located on the order of 18 miles southwest of the Concord Fault. The slip rate of the Concord Fault is estimated to be about 4 mm/year and has been assigned a moment magnitude (M_{max}) of 6.2 (CGS, 2002). UCERF3 estimated that there is a three percent probability of at least one magnitude 6.7 or greater earthquake before 2044 occurring on the Concord Fault, and seven percent probability of at least one magnitude 6.7 or greater earthquake before 2044 occurring on the Green Valley Fault.

3.4 Historic Seismicity

As discussed above, the San Francisco Bay Area is subject to a high level of seismic activity. Within the period of 1800 to 2000 there were an estimated 20 earthquakes exceeding a Richter magnitude of 6.0 within a 100-mile radius of the site, seven exceeding 6.5, four exceeding 7.0 and one exceeding 7.5. There have been six major Bay Area earthquakes since 1800. Those were in 1836 and 1868 on the Hayward-Rodgers Creek Fault, in 1861 on the Calaveras Fault, and in 1838, 1906, and 1989 on the San Andreas Fault.

Of the major earthquakes known to have affected the site, the 1868 Hayward earthquake caused the most damage with at least 30 deaths in the region and with extensive building collapse in Hayward and San Leandro, including the Alameda County Courthouse in San Leandro. The 1906 San Francisco earthquake and the 1989 Loma Prieta earthquake also caused property and extensive structural damage in the vicinity. The project site is located approximately ½ mile southeast of the portion of the Cypress structure which collapsed in the 1989 earthquake. However, the collapsed portion of the structure was underlain by soft Bay Mud as opposed to Merritt Sand underlying the project site.

4.0 SUBSURFACE CONDITIONS

4.1 Subsurface Soil Conditions

During our subsurface exploration program, we investigated the subsurface soils and evaluated soil conditions to a maximum depth of 50 feet in the four borings and 29 feet in the four CPTs performed for this study. From our collected data, we conclude that where explored, the area of the proposed new construction is underlain by Merritt sands, consisting of dark brown sand to silty sand layers with frequent lenses of medium dense to very dense, clayey to silty sand to a depth of about 27 feet, below which primarily clean, fine sand was encountered to a depth of about 50 feet. The consistency of the sand layers was found to be loose in the upper three to five feet, becoming denser immediately after. The CPTs encountered what appeared to be primarily fine grained sands to refusal depths of 27 to 29 feet.

Borings B-1 and B-2 were drilled at the proposed Main Building site in an existing paved area that was found to consist of about one inch of asphalt concrete overlying four to six inches of aggregate baserock. Below the pavement section, Boring B-1 encountered fill consisting of loose, fine sand mixed with brick and concrete fragments. Borings B-3 and B-4 were drilled in a landscape area at a previously considered future Server Building site encountering similar subsurface soil conditions as the Main Building site. Boring B-5 was drilled near the northeast entrance of the site in the area of the proposed MPR Building. Previous explorations conducted by Geosphere in 2015 encountered similar materials.

Atterberg Limit tests performed on one sample at a depth of about 15 feet in the area of the proposed MPR Building resulted in measured Liquid Limits (LL) of 17 and corresponding Plasticity Index (PI) of 5, indicative of low plasticity and low expansion potential which suggest that the sample may be susceptible to liquefaction.

Our interpretation of the general subsurface geologic conditions below the Office Building site is presented in Plate 5a, *Cross Sections A-A' and B-B'* and Plate 5b, *Cross Section C-C'*. Additional details of materials encountered in the exploratory borings, including laboratory test results are included in the boring logs in Appendix A, and laboratory test summaries are presented in Appendix B. Also, details of CPT test results including soil behavior type (SBT) are presented in Appendix A.

4.2 Groundwater

Free groundwater was encountered during drilling at Borings B-1 through B-4 at a depth of approximately 19 feet and were measured after drilling completion at a depth of approximately 18 feet. Groundwater was encountered at Boring B-5 at a depth of 17 feet during drilling and 14 feet after completion of drilling. Pore-pressure dissipation tests performed in the CPTs estimated that free groundwater may be at depths ranging from 13 to 15 feet. A historic high groundwater depth is estimated to be about 12 feet deep based on historic high groundwater table contours presented in Plate 1.2 of the Seismic Hazard Zone Report 081 for the Oakland West Quadrangle (CGS, 2003). The borings and CPTs were backfilled with a neat cement grout in accordance with Alameda County Public Works Agency requirements shortly after drilling. We note that the borings may not have been left open for a sufficient period of time to establish equilibrium groundwater conditions. Groundwater levels can vary in response to time of year, variations in seasonal rainfall, well pumping, irrigation, and alterations to site drainage. A detailed investigation of local groundwater conditions was not performed and is beyond the scope of this study.

4.3 Corrosion Testing

A sample collected from the upper five feet of the soil profile at Boring B-2 was tested to measure sulfate content, chloride content, redox potential, pH, resistivity, and presence of sulfides. Test results are included in Appendix B and are summarized on Table 1.

Table 1: Summary of Corrosion Test Results

Soil Description	Sample Depth (feet)	Sulfate (mg/kg)	Chloride (mg/kg)	Redox (mV)	Resistivity (ohm-cm)	Sulfide	pH
Very Dark Brown Silty SAND (SM)	0-5	47	2	501	23,762	Negative	6.0

Water-soluble sulfate can affect the concrete mix design for concrete in contact with the ground, such as shallow foundations, piles, piers, and concrete slabs. Section 4.3 in American Concrete Institute (ACI) 318, as referenced by the CBC, provides the following evaluation criteria:

Table 2: Sulfate Evaluation Criteria

Sulfate Exposure	Water-Soluble Sulfate in Soil, Percentage by Weight or (mg/kg)	Sulfate in Water, ppm	Cement Type	Max. Water Cementitious Ratio by Weight	Min. Unconfined Compressive Strength, psi
Negligible	0.00-0.10 (0-1,000)	0-150	NA	NA	NA
Moderate	0.10-0.20 (1,000-2,000)	150-1,500	II, IP (MS), IS (MS)	0.50	4,000
Severe	0.20-2.00 (2,000-20,000)	1,500-10,000	V	0.45	4,500
Very Severe	Over 2.00 (20,000)	Over 10,000	V plus pozzolan	0.45	4,500

The water-soluble sulfate content was measured to be about 47 mg/kg (ppm) or 0.0047% by dry weight in the soil sample, suggesting the site soil should have negligible impact on buried concrete structures at the site. However, it should be pointed out that the water-soluble sulfate concentrations can vary due to the addition of fertilizer, irrigation, and other possible development activities.

Table 4.4.1 in ACI 318 suggests use of mitigation measures to protect reinforcing steel from corrosion where chloride ion contents are above 0.06% by dry weight. The chloride content was measured to be 2 mg/kg (ppm) or 0.0002% by dry weight in the soil sample. Therefore, the test result for chloride content does not suggest a corrosion hazard for mortar-coated steel and reinforced concrete structures due to high concentration of chloride.

In addition to sulfate and chloride contents described above, pH, oxidation reduction potential (Redox), and resistivity values were measured in the soil sample. For cast and ductile iron pipes, an evaluation was based on the 10-Point scaling method developed by the Cast Iron Pipe Research Association (CIPRA) and as detailed in Appendix A of the American Water Works Association (AWWA) publication C-105, and shown on Table 3.

Table 3: Soil Test Evaluation Criteria (AWWA C-105)

Soil Characteristics	Points		Soil Characteristics	Points
Resistivity, ohm-cm, based on single probe or water-saturated soil box.			**Redox Potential, mV**	
<700	10		>+100	0
700-1,000	8		+50 to +100	3.5
1,000-1,200	5		0 to 50	4
1,200-1,500	2		Negative	5
1,500-2,000	1		**Sulfides**	
>2,000	0		Positive	3.5
PH			Trace	2
0-2	5		Negative	0
2-4	3		**Moisture**	
4-6.5	0		Poor drainage, continuously wet	2
6.5-7.5	0		Fair drainage, generally moist	1
7.5-8.5	0		Good drainage, generally dry	0
>8.5	5			

Assuming fair site drainage, the tested soil sample had a total score of 1 point, indicating a non-corrosive rating. When total points on the AWWA corrosivity scale are at least 10, the soil is classified as corrosive to cast and ductile iron pipe, and use of cathodic corrosion protection is often recommended.

These results are preliminary, and provide information only on the specific soil sampled and tested. Other soil at the site may be more or less corrosive. Providing a complete assessment of the corrosion potential of the site soils are not within our scope of work. For specific long-term corrosion control design recommendations, we recommend that a California-registered professional corrosion engineer evaluate the corrosion potential of the soil environment on buried concrete structures, steel pipe coated with cement-mortar, and ferrous metals.

5.0 GEOLOGIC HAZARDS

5.1 Seismic Induced Hazards

Seismic hazards resulting from the effects of an earthquake generally include ground shaking, liquefaction, lateral spreading, dynamic settlement, fault ground rupture and fault creep, seismically-induced landsliding, and tsunamis and seiches. The site is not necessarily impacted by all of these potential seismic hazards. Nonetheless, potential seismic hazards are discussed and evaluated in the following sections in relation to the planned construction.

5.1.1 Ground Shaking

The site may experience strong to severe ground shaking from a major earthquake originating from the major Bay Area faults, particularly the nearby Hayward Fault (approximately 4 miles from the site), Calaveras Fault (14 miles from the site), or San Andreas Fault (14½ miles from the site). Moderate shaking may also be generated at the site by the Concord-Green Valley Fault (approximately 18 miles from the site).

5.1.2 Liquefaction

Research and historical data indicate that soil liquefaction generally occurs in saturated, loose granular soil (primarily fine to medium-grained, clean, poorly-graded sand deposits) during or after strong seismic ground shaking and is typified by a loss of shear strength in the affected soil layer, thereby causing the soil to flow as a liquid. Typically, liquefaction potential increases with increased duration and magnitude of cyclic loading. However, because of the higher intergranular pressure of the soil at greater depths, the potential for liquefaction is generally limited to the upper 40 feet of the soil. Potential hazards associated with soil liquefaction below or near a structure include loss of foundation support, lateral spreading, sand boils, and areal and differential settlement. No specific liquefaction related ground failures other than isolated ground settlement in old tidal marsh areas in the vicinity of Lake Merritt and the Oakland Estuary were reported as a result of the 1906, 1868, or 1989 earthquakes (Youd and Hoose, 1978; Plafker and Galloway, 1989).

The site has been mapped as within a Seismic Hazard Zone for liquefaction based on the State of California, Official Map of the Oakland West Quadrangle released on February 14, 2003. The site location relative to these zones is shown on Plate 6, *Seismic Hazard Zones Map*. The soils encountered in the subsurface investigation below the

water table included layers of dense to very dense sand that may be susceptible to liquefaction in response to strong ground shaking.

To analyze for liquefaction settlement, we utilized the CLiq v 2.2.1.11 software, developed by Geologismiki, Geotechnical Software. Calculation of soil resistance against liquefaction is performed according to the Robertson (NCEER R&W 1998, 2009) procedure and as recommended on CGS Special Publication 117 A (2008). The procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). This methodology compares a critical Cyclic Shear Stress (CSR) against the field Cyclic Resistance Ratio (CRR). When the CSR exceeds the CRR, the factor-of-safety falls below 1.0 and liquefaction can occur.

All CPTs were identified as susceptible to potential seismic settlement through liquefaction. Borings were not used for liquefaction analysis since sampling (and SPT blow counts) were not continuous and as such, were considered to be less accurate for liquefaction evaluation. For analysis purposes, ASCE 7-16 specifies the use of Peak Ground Acceleration PGA_M for use in liquefaction analyses or a PGA value generated from a site-specific seismic response analysis. A PGA_M value of 0.7g, generated from a site-specific seismic response analysis was used in our calculation. We also used a Mean Magnitude of 6.9 based on the return period of 10 percent in 50 years in the Unified Hazard Tool Deaggregation Report. Based on historic high groundwater table contours presented in Plate 1.2 of the Seismic Hazard Zone report 081 for the Oakland West Quadrangle (CGS, 2003), a historic high groundwater depth of 12 feet was assumed for the analysis. Per SP117A (2008) guidelines, we also assumed a Factor-of-Safety (FS) of 1.3 below which would initiate liquefaction.

The following table presents a summary of our analysis results. A summary report of the analyses is presented in Appendix C of this report.

Table 4: Seismic Settlement Analysis Results

CPT No.	Calculated Liquefaction Settlement (inches)	Calculated Dynamic Compaction Settlement (inches)	Calculated Total Seismic Settlement (inches)
CPT-1	0.34	0.08	0.42
CPT-2	0.62	0.10	0.72
CPT-3	0.66	0.02	0.68
CPT-4	0.53	0.04	0.57

Based on the analysis results, in our opinion, it is reasonable to assume that seismically-induced settlements at the project site due to the design earthquake may potentially range between on the order of ⅓ to ¾ inch with differential settlements across the site generally considered to be ½ to ⅔ the maximum estimated total seismic settlement value. These settlements were calculated to occur in discontinuous layers primarily between depth intervals of 15 to 18 feet. Assuming a 1-meter-thick liquefiable zone overlain by 5 meters of non-liquefiable materials, per Youd and Garris (1995), it is our opinion that the calculated values of potential liquefaction settlement would not result in significant surface manifestation of such liquefaction settlement, and that significant post-seismic reduction in the bearing capacities of the existing overlying soils would not occur.

5.1.3 Lateral Spreading

Lateral spreading involves both vertical and lateral ground movement, with some vertical component, as a result of liquefaction. In addition to liquefaction, a free face or slope is necessary in most cases for lateral spreading to occur. Lateral spreading can occur on relatively flat sites with slopes less than two percent under certain circumstances, and manifest itself at the ground surface in the form of cracking and settlement. Lateral spreading can occur in areas located within close proximity to an open face which are supported by underlying liquefiable soil under or close to the open face. Under a lateral spreading condition, soils which liquefy lose strength and the slope moves towards the open face. Any structures or improvements located within close proximity to the slope can also move and possibly be destabilized.

No significant free slope faces are present within the general vicinity of the project site. In addition, no significant continuous liquefiable subsurface layers underlying the site were identified in our exploration. Therefore, it is our opinion that the potential for the occurrence of lateral spreading effects (i.e., surface cracking, settlement) significant enough to structurally impact the new buildings is very low to nil.

5.1.4 Dynamic Compaction (Settlement)

Dynamic compaction is a phenomenon where loose, sandy soil located above the water table densified from vibratory loading, typically from seismic shaking or vibratory equipment. The site is generally underlain by layers of medium dense to very dense silty to clayey sand. Based on our evaluation of the composition, measured density and strength of the soils encountered above the historic high ground-water table depth in the borings, and CLiq calculation results, potential dynamic settlements for the design seismic event are anticipated to be less than 0.1 inch.

5.1.5 Fault Ground Rupture and Fault Creep

A Regional Fault Map is shown on Plate 4. The State of California adopted the Alquist-Priolo (A-P) Earthquake Fault Zone Act of 1972 (Chapter 7.5, Division 2, Sections 2621 – 2630, California Public Resources Code), which regulates development near active faults for the purpose of preventing surface fault rupture hazards to structures for human occupancy. In accordance with the Alquist-Priolo (A-P) Act, the California Geological Survey established boundary zones or A-P "Earthquake Fault Zones" surrounding faults or fault segments judged to be sufficiently active, well-defined and mapped for some distance. These zones generally extend at least 500 feet on each side of a mapped or inferred trace of an active fault. Structures for human occupancy within designated Earthquake Fault Zone boundaries are not permitted unless surface fault rupture and fault creep hazards are adequately addressed in a site-specific evaluation of the development site.

The site is not currently within a designated Earthquake Fault Zone as defined by the State (Hart and Bryant, 1997), as shown on Plate 6. The closest Earthquake Fault Zone is that of the Hayward Fault, which is located about four miles east of the site (not shown on Plate 6). Since the site is not within an Earthquake Fault Zone and no faults are known to be present that are within or toward the project site, the potential for fault ground rupture and surface manifestations from fault creep is judged to be very low to nil.

5.1.6 Tsunamis and Seiches

Tsunamis are long-period sea waves generated by seafloor movements from submarine earthquakes or volcanic eruptions that rapidly displace large volumes of water. Coastal communities along the Pacific Ocean are particularly susceptible to such phenomena. In accordance with CEMA et al. (2009), the edge of the potential tsunami inundation area in closest proximity to the project site is near the intersection of Mandela Parkway and 15th Street, located about ¼ mile northwest of the site. Therefore, the site is not expected to be susceptible to tsunami inundation.

Earthquake-induced waves generated within enclosed bodies of water are called seiches. The nearest significant enclosed body of water is Lake Merritt, located about 1.4 aerial miles east of the site and is separated by urban developed land of downtown Oakland. The City of Oakland Safety Element (2004, Amended 2012) does not identify a seiche from Lake Merritt as a potential seismic hazard for Oakland. Due to these factors, the site is not considered to be susceptible to seiches.

5.2 Other Hazards

Potential geologic hazards other than those caused by a seismic event generally include ground failure and subsidence, consolidation settlement, landslides under static loading conditions, expansive and collapsible soils, flooding, naturally occurring asbestos (NOA) and soil erosion. These are discussed and evaluated in the following sections.

5.2.1 Ground Cracking and Subsidence

Withdrawal of groundwater and other fluids (i.e. petroleum and the extraction of natural gas) from beneath the surface has been linked to large-scale land subsidence and associated cracking on the ground surface. Other causes for ground cracking and subsidence include the oxidation and resultant compaction of peat beds, the decline of groundwater levels and consequent compaction of aquifers, hydrocompaction and subsequent settlement of alluvial deposits above the water table from irrigation, or a combination of any of these causes. However, subsidence generally impacts a region, and should not produce excessive differential settlement in a single location, such as the subject site. Local and regional locations prone to subsidence generally subside equally over time.

5.2.2 Settlement Due to Consolidation

Consolidation is the densification of soil into a more dense arrangement from additional loading, such as new fills or foundations. Consolidation of clayey soils is usually a long-term process, whereby the water is squeezed out of the soil matrix with time. Sandy soils consolidate relatively rapidly with an introduction of a load. Consolidation of soft and loose soil layers and lenses can cause settlement of the ground surface or buildings. Based on visual observation in the field, and laboratory testing, the subsurface soils are primarily granular, so are not considered to be susceptible to long-term consolidation settlement. However, the uppermost four feet underlying the site consists of loose sands which may be susceptible to immediate compression settlement due to imposed footing loads, as well as minor settlement due to earthquake shaking as discussed in Sections 5.1.2 and 5.1.4. Immediate compression settlements of these near surface loose sandy soils can be controlled by limiting the magnitude of building loads, or minimized by either deepening the building foundations to bear on denser underlying soils or by reworking loose soils under footings as compacted, engineered fill.

5.2.3 Landsliding

Landslides can occur under a variety of loading conditions, including both static and seismic, but involve sloping ground. As shown on Plate 6, the site is not within a zone of seismically-induced landslide investigation. The site and immediate vicinity are relatively flat, covered by urban development, and does not exhibit landslide features as determined by our site reconnaissance and literature review. Therefore, the site is not considered susceptible to landsliding.

5.2.4 Expansive and Collapsible Soils

The subsurface deposits encountered during the drilling program generally consisted of moist to wet, medium dense to very dense clayey to silty sand. Collapsible soils are fine sandy and silty soils that have been laid down by the action of flowing water, usually in alluvial fan deposits. Terrace deposits and fluvial deposits can also contain collapsible soil deposits. The soil particles are usually bound together with a mineral precipitate. The loose structure is maintained in the soil until a load is imposed on the soil and water is introduced. The water breaks down the inter-particle bonds and the newly imposed loading densifies the soil.

The potential for collapsible soils underlying the site is considered to be low provided that our recommendations are followed. Visual observation of selective samples of the near-surface soils indicated the soils to be of low plasticity, and the near-surface soils are considered to be generally of very low expansion potential. In addition, the soil did not show visual evidence of collapse potential.

5.2.5 Flooding

The site does not appear to be subject to significant flooding, as indicated in the Safety Element of the City of Oakland General Plan (adopted 2004, amended 2012). As shown on Plate 7, *Flood Hazard Map*, FEMA (2009), the project site is mapped as within the portion of Zone X outside the 0.2 percent annual chance floodplain.

The City of Oakland Safety Element also shows the site as not located within a potential dam failure inundation zone. The nearest source of potential flooding inundation of the site due to dam failure is Upper and Lower Edwards Reservoirs in Piedmont, located on the order of 3⅓ aerial miles northeast of the site. The theoretical dam failure inundation zone for these reservoirs is along the narrow creek channel of Glen Echo Creek, which discharges into Lake Merritt at Grand Avenue, about 1½ miles northeast of the site. Therefore, based on our

reviewed data, we conclude that the hazard of significant flooding of the site due to dam failure to be essentially nil.

An in-depth engineering evaluation of the flooding potential of the site is beyond the scope of this study or our expertise, and a flood specialist should be contacted if a more in-depth flooding analysis is desired.

5.2.6 Soil Erosion

Present construction techniques and agency requirements have provisions to limit soil erosion and resultant siltation during construction. These measures will reduce the potential for soil erosion at the site during the various construction phases. Long-term erosion at the site will be reduced by landscaping and hardscape areas, such as parking lots and walkways, designed with appropriate surface drainage facilities.

5.2.7 Naturally Occurring Asbestos (NOA)

No sources of NOA have been mapped in the vicinity of the site and therefore the potential for NOA to impact the site is very low.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations are based upon the analysis of the information gathered during the course of this study and our understanding of the proposed improvements.

6.1 Conclusions

The site is considered geologically and geotechnically suitable for the proposed improvements provided the recommendations of this report are incorporated into the design and implemented during construction. The predominant geotechnical and geological issues that need to be addressed at this site are summarized below.

Seismic Ground Shaking – The site is located within a seismically active region. As a minimum, the building design should consider the effects of seismic activity in accordance with the latest edition of the California Building Code (CBC).

Loose Surficial/Artificial Soil – A surficial loose layer up to four feet in thickness was encountered in all of our borings and CPTs, and in at least one boring was identified as undocumented fill. In order to provide uniform bearing support and to limit abrupt differential settlements beneath the structures, we recommend the new buildings be supported on a reworked engineered fill layer. Detailed recommendations for remedial earthwork and foundation design as part of our mitigation recommendations are contained in the earthwork and foundations sections of this report.

Seismic Settlements – The site is mapped as being located in a zone of potential liquefaction settlement. Based on the subsurface soil encountered and its characteristics, and the results of our liquefaction analysis, liquefaction settlement of soils below historic high groundwater table may occur at the site in response to the design seismic event. Liquefaction settlement was calculated in all four CPT's as occurring within discrete granular layers between depths of about 15 and 18 feet, with calculated total site settlements of ⅓ to ¾ inches resulting from the design earthquake event. Dynamic compaction of soils above historic high groundwater table was also calculated to occur in the CPTs but was not found to be significant (i.e., 0.1 inch or less). Potential differential settlements across the structure may be considered to be on the order of ½ to ⅔ of the aforementioned total seismic settlement range. These settlements are considered to be relatively minor and occurring at sufficient depth as to not result in a significant degree of surface manifestation of liquefaction, due to the thickness of non-liquefiable capping soil at the site, including our recommended construction of an engineered fill layer supporting the structure. As such,

significant strength loss of the near-surface soils of an extent to induce foundation failure is not expected to result from the design seismic event. In addition, we have provided conservative allowable bearing capacity values to also account for potential loss of bearing capacity.

Other potential geotechnical considerations, including those that should not significantly impact the project are explained below.

Groundwater – Relatively shallow groundwater was encountered at a depth of about 13 feet or greater during our field investigation. Therefore, with the exception of unanticipated shallow seepage, groundwater should not be problematic with placement of the anticipated shallow conventional foundations and associated over-excavations and all except for relatively deep utility trenches, if any.

Utility Connections – As a general suggestion, where utility damage during a design seismic event may be an issue, the design engineer should consider using utility connections at building perimeters designed for minimum of one inch of potential movement in any direction where the utility enters the buildings. This flexibility would help accommodate potential differential movement during a seismic event.

Winter Construction – If grading occurs in the winter rainy season, appropriate erosion control measures will be required, and weatherproofing of the building pads, foundation excavations, and/or pavement areas should be considered. Winter rains may also impact foundation excavations and underground utilities.

6.2 Seismic Design Parameters

The proposed structures should be designed in accordance with local design practice to resist the lateral forces generated by ground shaking associated with a major earthquake occurring within the greater San Francisco Bay region. Based on the measured shear wave velocity at the site on all CPT's, subsurface conditions encountered in our borings, our evaluation of the geology of the site and extrapolating the site condition in mapped Pleistocene-epoch Merritt sand to 100 feet, we have estimated average shear wave velocity, V_{s30} of 300 meter/second and classifies the site as Site Class "D". In accordance with ASCE 7-16, Section 11.4.8, a ground motion hazard analysis is required for structures on Site Class "D" with S_1 greater than or equal to 0.2 (unless Exceptions are taken). Since the project site is mapped as S_1 equal to 0.6, a site specific ground motion analysis in accordance with CBC 2019 and ASCE 7-16, Section 21.2.1.2, was performed for the site, as requested by the Structural Engineer.

6.2.1 Probabilistic (MCE_R) Ground Motions

A Probabilistic Seismic Hazard Analysis was performed for a 2,475-year return period ground motion corresponding to a 2% probability that the ground motion will be exceeded over a 50-year period. The analysis was performed using the 2014 USGS Unified Hazard Tool, Dynamic Ed., which includes the attenuation relationships of Abrahamson et al. (2014) NGA West 2, Boore et al. (2014) NGA West 2, Campbell-Bozorgnia (2014) NGA West 2, and Chiou-Youngs (2014) NGA West 2. The Method 2 analysis was carried out using the USGS Risk-Targeted Ground Motion Calculator. The resultant spectral accelerations were then scaled up by maximum direction scale factors presented in Section 21.2. The results are presented in Appendix D, *Site Specific Ground Motion Analysis*.

6.2.2 Deterministic (MCE_R) Ground Motions

A site specific deterministic analysis (ASCE 7-16, Section 21.2.2), was performed for all known influential seismic sources in the region as shown on USGS Deaggregation website, using the USGS Response Spectra Application. The attenuation relationships of Abrahamson et al. (2014) NGA West 2, Boore-et al (2014) NGA West 2, Campbell-Bozorgnia (2014) NGA West 2, and Chiou-Youngs (2014) NGA West 2 were utilized. The highest acceleration for each period, comparing the different faults, was used and compared to the deterministic lower limit as shown in Figure 21.2.1 (ASCE 7-16). Based on our analysis, the design earthquake occurring on the Hayward: HN+HS+HE at a rupture distance of 7.5 km from the project site, was found to govern the site. The results are presented in Appendix D.

6.2.3 Site-Specific MCE_R

The site specific Risk Targeted Maximum Considered Earthquake ground motion was then determined per ASCE 7-16, Section 21.2.3 by taking the lower of the spectral accelerations taken from the probabilistic and deterministic analysis performed per ASCE 7-16, Sections 21.2.1 and 21.2.2. The results are presented in Appendix D.

6.2.4 Design Response Spectrum

The design response spectral acceleration was calculated per ASCE 7-16, Section 21.3 and compared to the design response spectrum from ASCE 7-16, Section 11.4.6 to verify that the values from the site specific analysis meet the requirement of not less than 80 percent of the accelerations obtained from Section 11.4.6. If the values were

less than the 80 percent requirement, they were then raised to the 80 percent value to obtain the final Design Response Spectrum S_a (g). The results are presented in Appendix D.

The adjusted maximum spectral response accelerations and designed spectral response acceleration values were determined from the site specific analysis as per ASCE 7-16, Section 21.4 and were confirmed that the values are not less than 80 percent of the values obtained from, ASCE 7-16, Section 11.4.3 and 11.4.4.

6.2.5 Design Acceleration Parameters

The design acceleration parameters were calculated per ASCE 7-16, Section 21.4 and the values were compared to verify that the values meet the requirement of not less than 80 percent of the values determined in accordance with Section 11.4.3 and 11.4.4.

6.2.6 Peak Ground Acceleration (PGA)

Peak Ground Acceleration (PGA) was determined per ASCE 7-16, Section 21.5 by taking the lower of the PGA determined by the probabilistic ground motions, and deterministic ground motions, not less than 80 percent of PGA_M determined from ASCE 7-16, equation 11.8 -1. The results are presented in Appendix D.

6.2.7 Conclusions

For design of the site structures in accordance with the seismic provisions of the CBC 2019 and American Society of Civil Engineers (ASCE) 7-16, the following design seismic ground motion values are recommended. The results are presented in Appendix D. The structural engineer should refer to ASCE Section 21.4 for permitted usage.

Table 5: Seismic Design Parameters Based on 2019 CBC (ASCE 7-16)

Site Class	D
Mapped Spectral Response Accelerations	
Short Period, S_S	1.592 g
1-second Period, S_1	0.6 g
Adjusted Maximum Spectral Response Accelerations	
Short Period, S_{MS}	1.778 g
1-second Period, S_{M1}	1.650 g
Design Spectral Response Accelerations	
Short Period, S_{DS}	1.185 g
1-second Period, S_{D1}	1.100 g
Site-Specific Peak Ground Acceleration (PGA)	0.700 g

6.3 Site Grading and Site Preparation

6.3.1 General Grading, Demolition, Preparation and Site Drainage

Site grading should be performed in accordance with these recommendations. A pre-construction conference should be held at the jobsite with representatives from the owner, general contractor, grading contractor, and CEL prior to starting the clearing and demolition operations at the site.

Following demolition of the existing site pavements in the proposed project area, as well as clearing and grubbing of landscape areas, site grading is generally anticipated to consist of overexcavation and construction of the engineered fill supporting layer for the new building pads, as well as minor cuts and fills required to establish new site grades as required. In existing landscape areas within proposed new construction, organic topsoils should be completely removed and may be re-used as landscape topsoil, but should not be used as structural fill.

On-site soils having an organic content of less than three percent by weight and meeting the size requirements for import fill can be reused as structural, non-expansive (i.e., select) backfill as approved by the Geotechnical Engineer. Onsite soils containing construction debris such as brick or concrete should not be reused unless oversize material is removed prior to use. Tree roots exceeding one inch in diameter shall be removed if encountered in any excavated soils proposed for re-use.

Imported select soil should be non-expansive, having a Plasticity Index of 12 or less, an R-Value greater than 40, and contain sufficient fines so the soil can bind together. Import general fill soil for mass grading should be at least of comparable quality as the existing onsite soils, and in any case shall be approved by the Geotechnical Engineer prior to use on the project. Imported materials should be free of environmental contaminants, organic materials and debris, and should not contain rocks or lumps greater than six inches in maximum size, and at least 95 percent smaller than three inches in maximum size. In general, recycled baserock material containing recycled asphalt concrete should not be used in building pad areas. All import fill materials should be approved by the Geotechnical Engineer prior to use on site.

Excavations resulting from the removal of abandoned underground utilities, or deleterious materials should be cleaned down to firm soil, processed as necessary, and backfilled with engineered fill in accordance with the grading sections of this report. The Geotechnical Engineer's representative should verify the adequacy of site clearing operations during construction, prior to placement of engineered fill.

Existing underground utilities where encountered will need to be properly abandoned and/or entirely removed if impacting any proposed building, pavement or flatwork areas. In general, utility pipelines less than four inches in diameter to be abandoned may be left in place provided they will not be in close proximity to new foundation elements or interfere with new utilities. Such pipes should be plugged at the ends with concrete or sand-cement slurry. Larger utility pipelines or pipelines that underlie new foundations should be removed and replaced with engineered fill, or left in place and completely grouted with flowable sand-cement slurry or other approved Controlled Density Fill (CDF; also known as Controlled Low Strength Material, or CLSM).

Engineered fill should be placed in maximum eight-inch thick, pre-compacted lifts. The fill should be moisture conditioned and thoroughly mixed during placement to provide uniformity in each layer, and subsequently compacted per the requirements listed in Table 6.

Final grading should be designed to provide drainage away from structures and the top of slopes. Soil areas within 10 feet of proposed structures should slope at a minimum of 5% away from the buildings. Adjacent concrete hardscape should slope a minimum 2% away from the buildings. Roof leaders and downspouts should not discharge into landscape areas adjacent to buildings, and should discharge onto paved surfaces sloping away from the structures or into a closed pipe system channeled away from the structure to an approved collector or outfall.

6.3.2 Project Compaction Recommendations

The following table provides the recommended compaction requirements for this project. Not all soils, aggregates and scenarios listed below may be applicable for this project. Specific grading recommendations are discussed individually within applicable sections of this report.

Table 6: Project Compaction Requirements

Description	Min. Percent Relative Compaction (per ASTM D1557)	Min. Percent Above Optimum Moisture Content
Fill Areas, Engineered Fill, Onsite Soil/Select Fill	90	2
Building Pads, Onsite Soil – scarified subgrade or used as Fill	95	2
Building Pads, Baserock or Select Engineered Fill	95	2
Concrete Flatwork, Subgrade Soil	90	2
Concrete Flatwork, Baserock	90	2
Underground Utility Backfill (upper 3', below existing vehicular AC pavement sections)	95	2
Underground Utility Backfill (all other applications)	90	2

Description	Min. Percent Relative Compaction (per ASTM D1557)	Min. Percent Above Optimum Moisture Content
AC Pavement – Class 2 Aggregate Base Section (Vehicular/Traffic areas)	95	2
AC Pavement – Baserock in Non-Traffic (e.g., Playground) Areas	90	2
AC Pavement – Non-Expansive Subgrades in Vehicular/Traffic Areas (upper 8 inches)	95	2
AC Pavement –Non-Expansive Subgrades in Non-Traffic Areas	90	2

6.3.3 Building Pad Grading

To reduce potential abrupt differential settlement of the near surface soils as well as to provide uniform bearing support, the buildings should be supported by a layer of reworked, engineered fill. The fill layer should extend to at least four feet below existing ground surface, and be constructed by a combination of over-excavating the pad below the existing grade, scarifying the over-excavation subgrade to a depth of at least eight inches, and compacting the exposed surface to the project compaction requirements, and backfilling with compacted, engineered fill to the new building pad subgrades. Therefore, the scarified fill thickness can be considered to be a part of the required minimum four-foot engineered fill thickness. The engineered fill layer should extend at least five feet horizontally beyond the perimeter of the building footprints or as feasible if limited by nearby structures.

Engineered fill should be placed and compacted to final pad subgrade in accordance with the recommendations presented in Sections 6.3.1, 6.3.2 and Table 6. Due to the granular nature of the near-surface materials, excavating the edges of the over-excavations may require that slopes be cut back, as near-vertical slopes may not stand beyond the short-term.

6.3.4 Grading Flatwork/Pavement Areas

Areas to receive concrete hardscape or pavements should be scarified to a minimum depth of eight inches below existing grade or final subgrade whichever is lower. Scarified areas should be moisture conditioned and compacted. Where required, engineered fill should be placed and compacted to reach design subgrade elevation.

Rubber-tired heavy equipment, such as a full water truck, should be used to proof load exposed subgrade areas where pumping is suspected. Proof loading will determine if the subgrade soil is capable of supporting construction equipment without excessive pumping or rutting.

6.3.5 Site Winterization and Unstable Subgrade Conditions

If grading occurs in the winter rainy season, unstable and unworkable subgrade conditions may be present and compaction of onsite soils may not be feasible. These conditions may be remedied using soil admixtures, such as lime and cement. A four percent mixture of equal parts of lime and cement based on a dry soil unit weight of 105 pcf is recommended for planning purposes. Treatment should vary between 12 to 18 inches, depending on the anticipated construction equipment loads and extent of observed instability. More detailed and final recommendations can be provided during construction. Stabilizing subgrade in small, isolated areas can be accomplished with the approval of the Geotechnical Engineer by over-excavating one foot, placing Tensar TriAx TX140 or equivalent geogrid on the soil, and then placing 12 inches of Class 2 baserock on the geogrid. The upper six inches of the baserock should be compacted to at least 90 percent (building pads) or 95 percent (pavement subgrades) relative compaction.

6.4 Utility Trench Construction

6.4.1 Trench Backfilling

Utility trenches may be backfilled with onsite soil above the utility bedding and shading materials. If rocks or concrete larger than four inches in maximum size are encountered, they should be removed from the fill material prior to placement in the utility trenches. Utility bedding and shading compaction requirements should be in conformance with the requirements of the local agencies having jurisdiction and as recommended by the pipe manufacturers. Jetting of trench backfill is not recommended. Compaction recommendations are presented in Section 6.3.2, *Project Compaction Recommendations*.

Pea gravel, rod mill, or other similar self-compacting material should not be utilized for trench backfill since this material will transmit the shallow groundwater to other locations within the site and potentially beneath the building. Additionally, fines may migrate into the voids in the pea gravel or rod mill, which could cause settlement of the ground surface above the trench.

If rain is expected and the trench will remain open, the bottom of the trench may be lined with one to two inches of gravel. This would provide a working surface in the trench bottom. The trench bottom may have to be sloped to a low point to pump the water out of the trench.

6.4.2 Utility Penetrations at Building Perimeter

Flexible connections at building perimeters should be considered for utility lines going through perimeter foundations. This would provide flexibility during a seismic event. This could be provided by special flexible connections, pipe sleeving with appropriate waterproofing, or other methods.

6.4.3 Pipe Bedding and Shading

Pipe bedding material is placed in the utility trench bottom to provide a uniform surface, a cushion, and protection for the utility pipe. Shading material is placed around the utility pipe after installation and testing to protect the pipe. Bedding and shading material and placement are typically specified by the pipe manufacturer, agency, or project designer. Agency and pipe manufacturer recommendations may supersede our suggestions. These suggestions are intended as guidelines and our opinions based on our experience to provide the most cost-effective method for protecting the utility pipe and surrounding structures. Other geotechnical engineers, agency personnel, contractors, and civil engineers may have different opinions regarding this matter.

Bedding and Shading Material - The bedding and shading material should be the same material to simplify construction. The material should be clean, uniformly graded, fine to medium grained sand. It is suggested that bedding and shading material contain less than three percent fines with 100 percent passing the No. 8 sieve. Coarse sand, angular gravel or baserock should be avoided since this type of shading material may bridge when backfilling around the pipe, possibly creating voids, and may be too stiff as bedding material. Open graded gravel should be avoided for shading since this material contains voids, and the surrounding soil could wash into the voids, potentially causing future ground settlement. However, open graded gravel may be required for bedding material when water is entering the trench. This would provide a stable working surface and a drainage path to a sump pit in the trench for water in the trench. The maximum size for bedding material should be limited to about ¾ inch.

Bedding Material Placement - The thickness of the bedding material should be minimized to reduce the amount of trench excavation, soil export, and imported bedding material. Two to three inches for pipes less than eight-inches in diameter and about four to six inches for larger pipes are suggested. Bedding for very large diameter pipes are typically controlled by the pipe manufacturer. Compaction is not required for thin layers of bedding material. The pipe needs to be able to set into the bedding, and walking on a thin layer of bedding material should

sufficiently compact the sand. Rounded gravel may be unstable during construction, but once the pipe and shading material is in place, the rounded gravel will be confined and stable.

Shading Material Placement – Jetting is not recommended since the type of shading material is unknown when preparing the geotechnical report and agencies typically do not permit jetting. If the sand contains fines or if the sand is well graded, jetting will not work. Additionally, if too much water is used during jetting, this could create a wet and unstable condition. The shading material should be able to flow around and under the utility pipe during placement. Some compactive effort along the sides of the pipe should be made by the contractor to consolidate the shading material around the pipe. A minimum thickness of about six-inches of shading material should be placed over the pipe to protect the pipe from compaction of the soil above the shading material. The contractor should provide some compactive effort to densify the shading material above the pipe. Relative compaction testing is not usually performed on the shading material. However, the contractor is ultimately responsible for the integrity of the utility pipe.

6.5 Temporary Excavation Slopes and Shoring

Where temporary excavation slopes are required, the Contractor should incorporate all appropriate requirements of OSHA/ Cal OSHA into the design of any temporary construction slopes used during construction. Excavation safety regulations are provided in the OSHA Health and Safety Standards for Excavations, 29 CFR Part 1926, Subpart P, and apply to excavations greater than five feet in depth.

The Contractor, or his specialty subcontractor, should design temporary construction slopes to conform to the OSHA regulations and should determine actual temporary slope inclinations based on the subsurface conditions exposed at the time of construction. For pre-construction planning purposes, the subsurface materials in the areas of the site where excavation may take place may be assumed to consist of a silty sand mix categorized as OSHA Type C with temporary slope inclination of no steeper than 1.5:1 (horizontal to vertical). This maximum slope ratio is assumed to be uniform from top to toe of the slope. The type of slope material and actual temporary construction slopes should be confirmed or adjusted during construction by a person who is trained as a "competent person" as designated by OSHA and directly responsible to the grading contractor.

If temporary slopes are left open for extended periods of time, exposure to weather and rain could have detrimental effects such as sloughing and erosion on surficial soils exposed in the excavations. We recommend that all vehicles and other surcharge loads be kept at least 10 feet away from the top of temporary slopes, and

that such temporary slopes are protected from excessive drying or saturation during construction. In addition, adequate provisions should be made to prevent water from ponding on top of the slope and from flowing over the slope face. Desiccation or excessive moisture in the excavation could reduce stability and require shoring or laying back side slopes.

6.6 Building Foundations

6.6.1 Shallow Foundations

The proposed buildings can be supported on conventional continuous perimeter and interior spread footings bearing on the recommended engineered fill layer. Footings should have a minimum width of 18 inches and should be founded a minimum of 24 inches below lowest adjacent finished grade (i.e., pad subgrade for interior continuous footings, exterior compacted surface grade for exterior footings, not including loose landscape or topsoil material).

Footings located adjacent to other footings or utility trenches should bear below an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the adjacent footings or utility trenches. Footing reinforcement should be determined by the project Structural Engineer.

Footings should be designed for the following allowable bearing pressures, assuming design Factors-of-Safety of 3.0, 2.0 and 1.5 for dead loads, dead plus live loads and total loads, respectively, from the calculated ultimate bearing pressure.

Table 7: Allowable Bearing Pressures for Spread Footings

Load Condition	Allowable Net Bearing Pressure (psf)
Dead Load	3,000
Dead plus Live Loads	4,500
Total Loads (including wind or seismic)	6,000

If site preparation and foundation observation services are conducted as outlined in the Geotechnical Study report, static vertical settlement is expected to be on the order of ½ inch or less for footings bearing within the materials described in the report and designed to the aforementioned allowable bearing pressures. Differential settlement across the structure is not expected to exceed about ½ this value. In addition to the aforementioned

static settlements, potential post-construction seismic total and differential settlements resulting from a design earthquake as discussed in Sections 5.1.2 and 6.1 should be considered when designing the building foundations. To evaluate immediate (distortion) settlement of footing foundations using an elastic spring constant, a modulus of subgrade reaction value, k_{v1}, of 230 pounds per cubic inch may be assumed for footings bearing directly on onsite subsurface granular soils that have been improved through dynamic compaction, or for footings bearing on soil improvement columns. The k_{v1} value applies for a 1-foot by 1-foot area and should be adjusted for footing width to obtain the k_v value as follows:

$$K_v = K_{v1} \times (B+1/2B)^2$$

where B = width of the footing in feet.

CEL personnel should be retained to observe and confirm that footing excavations prior to formwork and reinforcing steel placement bear in engineered fill soils suitable for the recommended maximum design bearing pressure.

Footing excavations should have firm bottoms and be free from excessive slough prior to concrete or reinforcing steel placement. Care should also be taken to prevent excessive wetting or drying of the bearing materials during construction. Extremely wet or dry or any loose or disturbed material in the bottom of the footing excavations should be removed prior to placing concrete. If construction occurs during the winter months, a thin layer of concrete (sometimes referred to as a rat slab) could be placed at the bottom of the footing excavations. This will protect the bearing soil and facilitate removal of water and slough if rainwater fills the excavations.

6.6.2 Lateral Resistance

Shallow foundations can resist lateral loads with a combination of bottom friction and passive resistance, and for mat foundations, bottom friction only. An allowable coefficient of friction of 0.40 between the base of the foundation elements and underlying material is recommended. In addition, an allowable passive resistance equal to an equivalent fluid weighing 350 pounds per cubic foot (pcf) acting against the foundation may be used for lateral load resistance against the sides of footings perpendicular to the direction of loading where the footing is poured neat against engineered fill material. The top foot of passive resistance at foundations not adjacent to pavement or hardscape should be neglected. The friction between the bottom of a slab-on-grade floor and the underlying soil should not be utilized to resist lateral forces.

6.6.3 Foundations for Equipment Pads and Minor Structures

Foundations for equipment pads and other minor structures may be designed using the recommendations presented in Sections 6.6.1 and 6.6.2 provided that supporting subgrade is prepared in accordance with Section 6.3.3. However, if the foundation for a minor structure will not bear on the engineered fill layer, it should be designed using a reduced allowable dead plus live bearing capacity of 1,500 psf, a modulus of subgrade reaction value of k_{v1}, of 75 pci, a coefficient of friction of 0.35, and a passive pressure of 250 pcf.

6.7 Concrete Slabs-on-Grade

6.7.1 Interior Floor Slabs

Surficial onsite materials appeared low to non-plastic; therefore, a non-expansive fill layer is not required for the proposed building. Slab reinforcing as well as slab construction joints should be designed by the structural engineer or slab designer to satisfy the anticipated use and loading of the slab. Slab-on-grade subgrade surfaces should be proof-rolled to provide a smooth, unyielding surface for slab support.

If desired and where potential near-surface water seepage from irrigation or surface water sources may be a concern, slab-on-grade concrete floors with moisture sensitive floor coverings can be underlain by a moisture retarder system constructed between the slab and subgrade. Such a system could consist of four inches of free-draining gravel, such as ¾-inch, clean, crushed, uniformly graded gravel with less than three percent passing No. 200 sieve, or equivalent, overlain by a relatively impermeable vapor retarder placed between the subgrade soil and the slab. The vapor retarder should be at least 10-mil thick and should conform to the requirements for ASTM E 1745 Class C Underslab Vapor Retarders (e.g., Griffolyn Type 65, Griffolyn Vapor Guard, Moistop Ultra C, or equivalent). If additional protection is desired by the owner, a higher quality vapor barrier conforming to the requirements of ASTM E 1745 Class A, with a water vapor transmission rate less than or equal to 0.006 gr/ft^2/hr (i.e., 0.012 perms) per ASTM E 96 (e.g., 15-mil thick “Stego Wrap Class A”), or to Class B (Griffolyn Type 85, Moistop Ultra B, or equivalent) may be used in place of a Class C retarder.

The vapor retarder or barrier should be placed directly under the slab. A sand layer is not required over the vapor retarder from a geotechnical standpoint. If sand on top of the vapor retarder is required by the design structural engineer, we suggest the thickness be minimized to less than one inch. If construction occurs in the winter months, water may pond within the sand layer since the vapor retarder may prevent the vertical percolation of rainwater.

ASTM E1643 should be utilized as a guideline for the installation of the vapor retarder. During construction, all penetrations (e.g., pipes and conduits,) overlap seams, and punctures should be completely sealed using a waterproof tape or mastic applied in accordance with the vapor retarder manufacturer's specifications. The vapor retarder or barrier should extend to the perimeter cutoff beam or footing.

6.7.2 Exterior Concrete Flatwork

Exterior concrete flatwork with pedestrian traffic should be at least four-inches thick and placed on subgrade compacted to the applicable requirements in Table 6. If desired, an underlying baserock layer can be used at the option of the designing engineer.

6.8 Pavements

Recommendations for the design of flexible asphalt concrete pavement sections were developed in accordance with the procedures outlined in the latest edition of the Caltrans Highway Design Manual. The Caltrans design method uses Traffic Indices (TI) to represent anticipated wheel loads and frequency of usage for a given design life. A design life of 20 years is typically used in California. Factors such as surface and subsurface drainage have an effect on the overall life of a pavement section.

An R-value of 79 was obtained from a laboratory test on a sample of typical existing near-surface onsite materials. To account for potential local variation in the clay and silt content of the near-surface soils, an R-value of 45 was used for determining the design sections. Based on assumed Traffic Index values of 4.5, 5.0, 6.0 and 7.0, the following resulting structural asphalt concrete (AC)/ aggregate base (AB) pavement sections were developed based on the provided TI values.

Table 8: Recommended Pavement Design Alternatives

Traffic Index	Asphalt Concrete (in.)	Class 2 AB (in.)	Total Section (in.)
4.5	2.0	6.0*	8.0
5.0	2.5	6.0*	8.5
6.0	3.5	6.0*	9.5
7.0	4.0	6.0	10.0

* Minimum recommended AB thickness

Asphalt concrete pavement should be designed and constructed per Caltrans standards. The asphalt pavement should be placed in minimum 1½-inch thick compacted lifts and maximum 3-inch thick lifts.

Minimizing subgrade saturation is an important factor in maintaining subgrade strength. Water allowed to pond on or adjacent to pavements could saturate the subgrade and cause premature pavement deterioration. The pavement should be sloped to provide rapid surface drainage, and positive surface drainage should be maintained away from the edge of the paved areas. Design alternatives which could reduce the risk of subgrade saturation and improve long-term pavement performance include crowning the pavement subgrades to drain toward the edges, rather than to the center of the pavement areas; and installing surface drains next to any areas where surface water could pond, should be considered. Properly designed and constructed subsurface drainage will reduce the time subgrade soils are saturated and can also improve subgrade strength and performance.

Periodic maintenance extends the service life of the pavement and should include crack sealing, surface sealing and patching of any deteriorated areas. Also, thicker pavement sections could be used to reduce the required maintenance and extend the service life of the pavement. The owner/user should consider placing signs at entryways to deter heavy duty trucks from light duty pavement areas, or by extending concrete curbs to a depth of three inches below the pavement subgrade.

6.9 Stormwater Infiltration Design Considerations

In order to meet the requirements of Provision C.3 of the Bay Area Municipal Regional Stormwater Permit (MRP), post-construction stormwater controls would be required as part of the project, post-construction stormwater controls may be required as part of the project. Stormwater infiltration treatment systems utilizing measures such as biofiltration swales or planters, or pervious pavements or pavers should be designed considering the typical infiltration rates characteristic of the onsite surficial soils. The near-surface soils at the site were found to typically consist of sand with silt and clayey sand with little clay soils, and would likely be categorized as Hydrologic Soil Group “B” soils (USDA, 2007). In such a case where the infiltration rates may be too low to accommodate infiltration of collected stormwater into the underlying soils, the use of a subdrainage layer consisting of an appropriate permeable material will be required.

In general, biofiltration swales or basins should not be placed directly adjacent to building perimeters in order to minimize impact on the long-term performance of foundations. If such features must be constructed adjacent to foundations, the filter material should not be located within the footing zone of influence, considered to be the zone below an imaginary 1.5:1 (horizontal to vertical) plane projected downward from the bottom edge of the

adjacent building footing. In addition, the bottom of the bioswale or biofiltration area should include a perforated subdrain pipe to carry collected infiltration water away from the foundations.

Biofiltration swales should generally be placed a minimum of five feet away from pavements or exterior flatwork in order to reduce potential impacts on these features such as settlement or lateral movement. Where concrete curbs are located adjacent to bioswale or other filtration features, the loose biofiltration material should not be located within a zone below an imaginary 1:1 (horizontal to vertical) plane projected downward from the bottom edge of the adjacent curb. Curbs adjacent to deeper biofiltration features may also be designed as retaining walls with the bottom of the wall deriving passive resistance from soils below the adjacent biofiltration medium. Retaining walls may be designed assuming an ultimate lateral active pressure of 30 pcf EFP.

6.10 Plan Review

We recommend that CEL be provided the opportunity to review the final project plans prior to construction. The purpose of this review is to assess the general compliance of the plans with the recommendations provided in this report and confirm the incorporation of these recommendations into the project plans and specifications.

6.11 Observation and Testing During Construction

We recommend that CEL be retained to provide observation and testing services during site preparation, mass grading, underground utility construction, foundation excavation, and to observe final site drainage. This is to observe compliance with the design concepts, specifications and recommendations, and to allow for possible changes in the event that subsurface conditions differ from those anticipated prior to the start of construction.

7.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS

The recommendations of this report are based upon the soil and conditions encountered in the borings. If variations or undesirable conditions are encountered during construction, CEL should be contacted so that supplemental recommendations may be provided.

This report is issued with the understanding that it is the responsibility of the owner or his representatives to see that the information and recommendations contained herein are called to the attention of the other members of the design team and incorporated into the plans and specifications, and that the necessary steps are taken to see that the recommendations are implemented during construction.

The findings and recommendations presented in this report are valid as of the present time for the development as currently proposed. However, changes in the conditions of the property or adjacent properties may occur with the passage of time, whether by natural processes or the acts of other persons. In addition, changes in applicable or appropriate standards may occur through legislation or the broadening of knowledge. Accordingly, the findings and recommendations presented in this report may be invalidated, wholly or in part, by changes outside our control. Therefore, this report is subject to review by CEL after a period of three (3) years has elapsed from the date of issuance of this report. In addition, if the currently proposed design scheme as noted in this report is altered CEL should be provided the opportunity to review the changed design and provide supplemental recommendations as needed.

Recommendations are presented in this report which specifically request that CEL be provided the opportunity to review the project plans prior to construction and that we be retained to provide observation and testing services during construction. The validity of the recommendations of this report assumes that CEL will be retained to provide these services.

This report was prepared upon your request for our services, and in accordance with currently accepted geotechnical engineering practice. No warranty based on the contents of this report is intended, and none shall be inferred from the statements or opinions expressed herein.

The scope of our services for this report did not include an environmental assessment or investigation for the presence or absence of wetlands or hazardous or toxic materials in the soil, surface water, groundwater or air, on,

below or around this site. Any statements within this report or on the attached Plates, logs or records regarding odors noted or other items or conditions observed are for the information of our client only.

DESCRIPTION	
ON LAND	OFFSHORE
Displacement during historic time (e.g. San Andreas fault 1906). Includes areas of known fault creep.	
Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
Faults showing evidence of displacement during late Quaternary time.	Faults cuts strata of Late Pleistocene age.
Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Faults without recognized Quaternary displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.

MAP EXPLANATION

ALQUIST-PRIOLO EARTHQUAKE FAULT ZONES

Earthquake Fault Zones
Zone boundaries are delineated by straight-line segments; the boundaries define the zone encompassing active faults that constitute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Section 2621.5(a) would be required.

Active Fault Traces
Faults considered to have been active during Holocene time and to have potential for surface rupture: Solid Line in Black or Red where Accurately Located; Long Dash in Black or Solid Line in Purple where Approximately Located; Short Dash in Black or Solid Line in Orange where Inferred; Dotted Line in Black or Solid Line in Rose where Concealed; Query (?) indicates additional uncertainty. Evidence of historic offset indicated by year of earthquake-associated event or C for displacement caused by fault creep.

SEISMIC HAZARD ZONES

Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

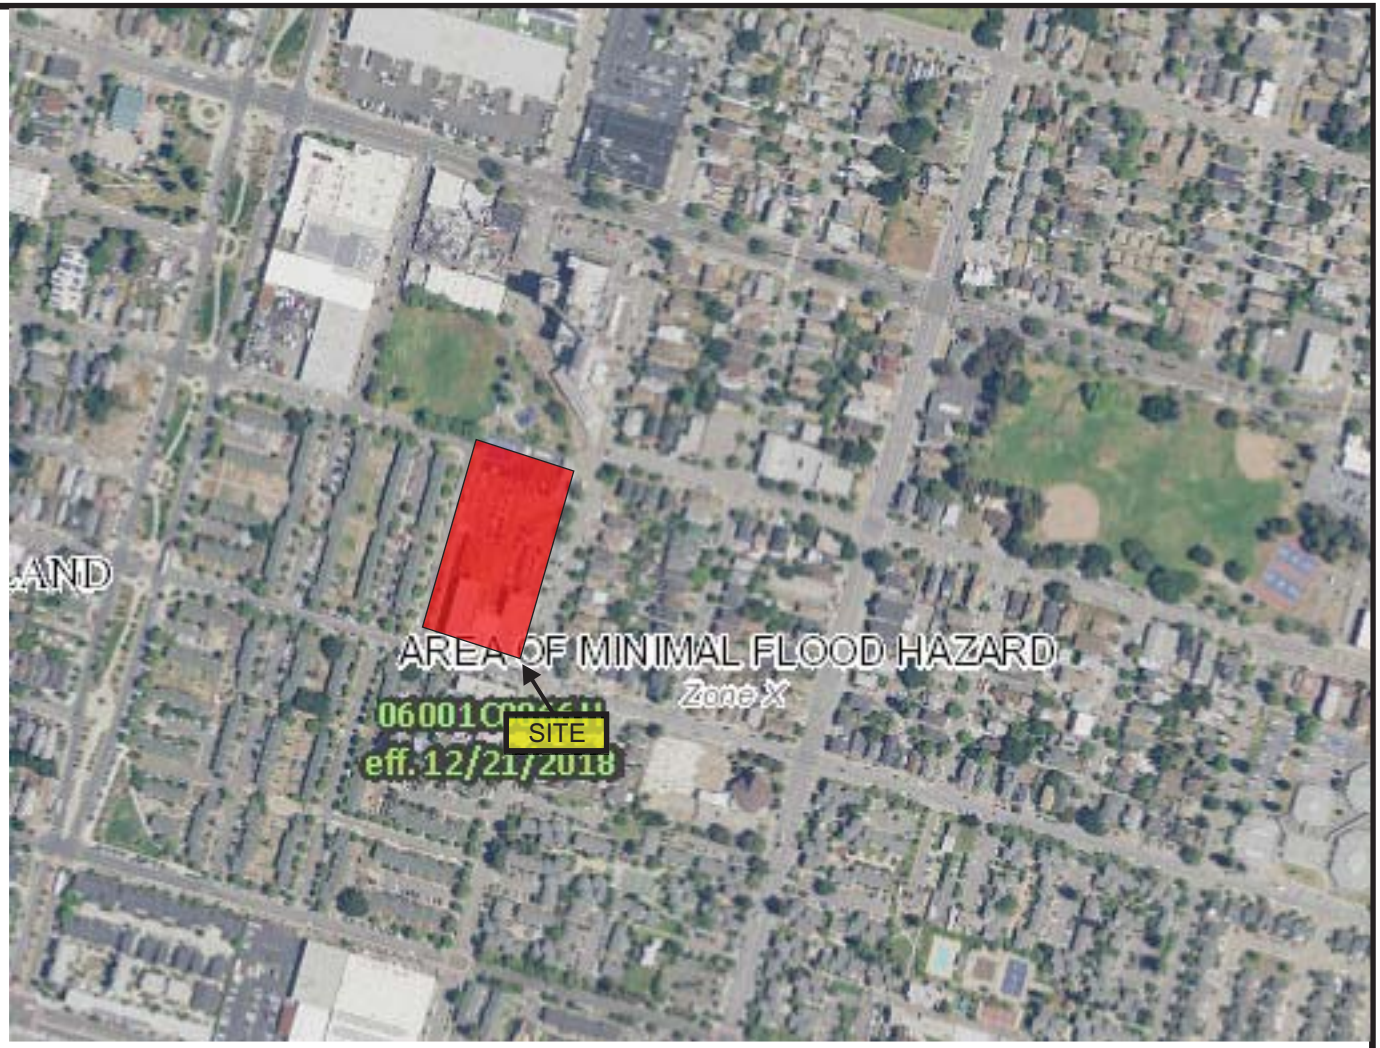
SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE



The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.

Saturated	Free Water in Sample

PARTICLES SIZES		
COMPONENTS		**SIZE OR SIEVE NUMBER**
Boulders		Over 12 Inches
Cobbles		3 to 12 Inches
Gravels	-Coarse	3/4 to 3 Inches
	-Fine	Number 4 to 3/4 Inch
Sand	-Coarse	Number 10 to Number 4
	-Medium	Number 40 to Number 10
	-Fine	Number 200 to Number 40
Fines (Silt and Clay)		Below Number 200

Grab Bulk Sample

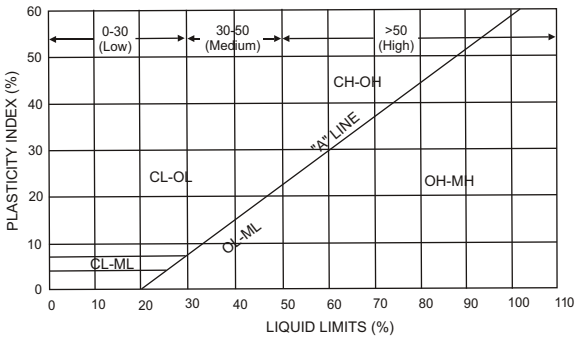
Standard Penetration Test

2.5 Inch Modified California

Shelby Tube

No Recovery

Initial Water Level Reading



Final Water Level Reading

Blow Count
The number of blows of the sampling hammer required to drive the sampler through each of three 6-inch increments. Less than three increments may be reported if more than 50 blows are counted for any increment. The notation 50/5" indicates 50 blows recorded for 5 inches of penetration.

N-Value
Number of blows 140 LB hammer falling 30 inches to drive a 2 inch outside diameter (1-3/8 inch I.D) split barrel sampler the last 12 inches of an 18 inch drive (ASTM-1586 Standard Penetration Test)

CU -Consolidated Undrained triaxial test completed. Refer to laboratory results
DS - Results of Direct Shear test in terms of total cohesion (C, KSF) or effective cohesion and friction angles (C', KSF and degrees)
LL - Liquid Limit
PI - Plasticity Index
PP - Pocket Penetrometer test
TV - Torvane Shear Test results in terms of undrained shear strength (KSF)
UC - Unconfined Compression test results in terms of undrained shear strength (KSF)
#200 - Percent passing number 200 sieve
Cu - Coefficient of Uniformity
Cc - Coefficient of Concavity

PLASTICITY CHART

General Notes

1. The boring locations were determined by pacing, sighting and/or measuring from site features. Locations are approximate. Elevations of borings (if included) were determined by interpolation between plan contours or from another source that will be identified in the report or on the project site plan. The location and elevation of borings should be considered accurate only to the degree implied by the method used.

2. The stratification lines represent the approximate boundary between soil types. The transition may be gradual.

3. Water level readings in the drill holes were recorded at time and under conditions stated on the boring logs. This data has been reviewed and interpretations have been made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, tides, temperature and other factors at the time measurements were made.

4. The boring logs and attached data should only be used in accordance with the report.

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

Project ID: CEL
Data File: SDF(326).cpt
CPT Date: 11/9/2019 9:27:06 AM
GW During Test: 14 ft

Sounding ID: CPT-01
Project No: 84-04726-PW
Cone/Rig: DDG1489

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

CEL

Location	Cole Campus	Operator	JM-AJ	
Job Number	84-04726-PW	Cone Number	DDG1489	GPS
Hole Number	CPT-01	Date and Time	11/9/2019 9:27:06 AM	
Equilized Pressure	1.2	EST GW Depth During Test	14.8	

Hammer to Rod String Distance (ft): 5.83
* = Not Determined

COMMENT:

Geo Testing Inc.

CEL

Project	Cole Campus	Operator	JM-AJ	Filename	SDF(325).cpt
Job Number	84-04726-PW	Cone Number	DDG1489	GPS	
Hole Number	CPT-02	Date and Time	11/9/2019 8:49:20 AM	Maximum Depth	29.20 ft
EST GW Depth During Test		13.40 ft			

Net Area Ratio .8

CPT DATA

1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

Cole Campus

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

Project ID: CEL
Data File: SDF(325).cpt
CPT Date: 11/9/2019 8:49:20 AM
GW During Test: 13 ft

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

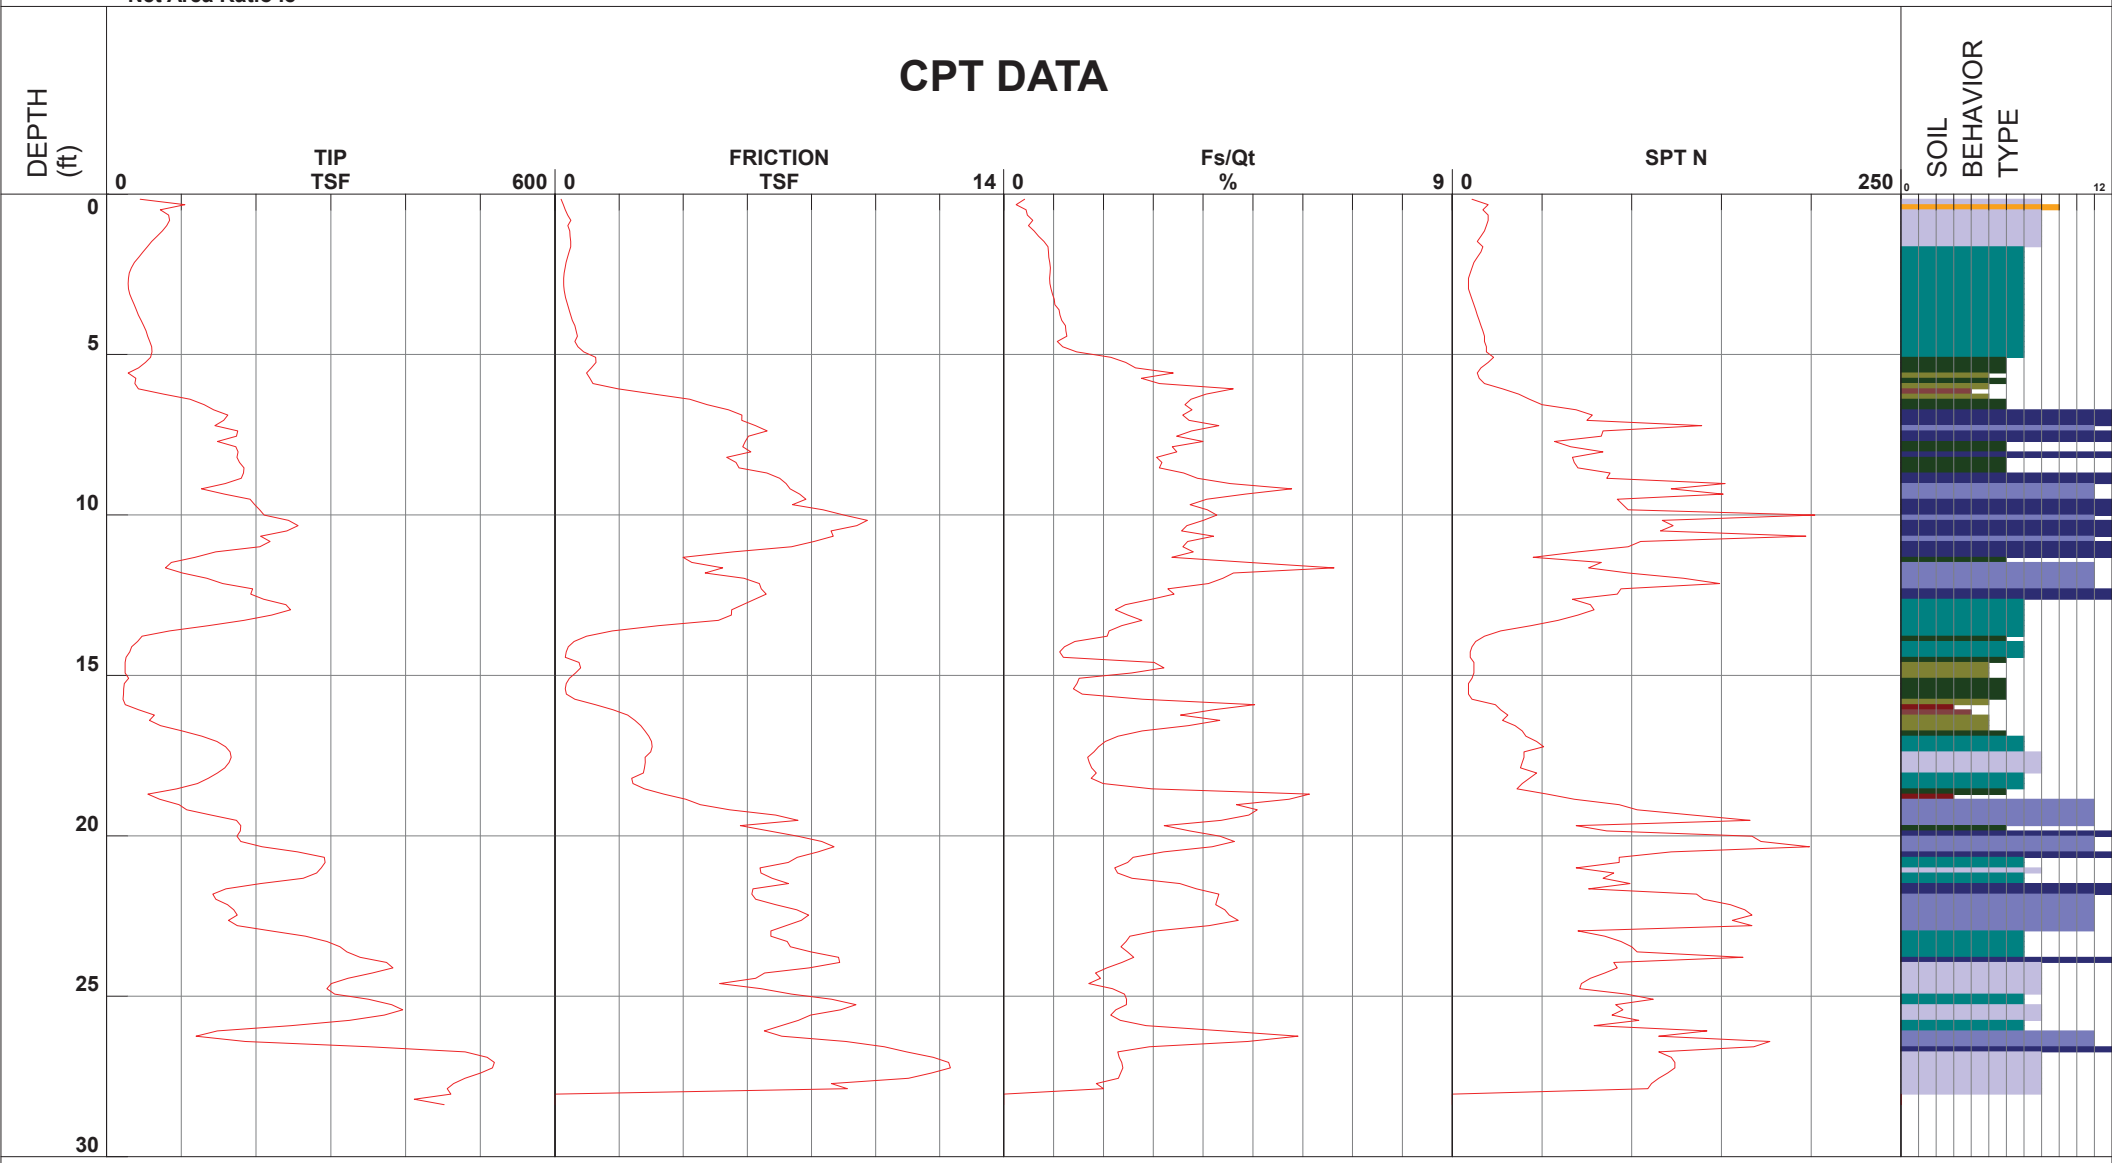
CPT-01

Cole Campus

Hammer to Rod String Distance (ft): 5.83

* = Not Determined

COMMENT:



Middle Earth
Geo Testing Inc.

CEL

Project	Cole Campus	Operator	JM-AJ	Filename	SDF(324).cpt
Job Number	84-04726-PW	Cone Number	DDG1489	GPS	
Hole Number	CPT-03	Date and Time	11/9/2019 7:51:37 AM	Maximum Depth	28.38 ft
EST GW Depth During Test		14.00 ft			

Net Area Ratio .8

CPT DATA

1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

Cole Campus

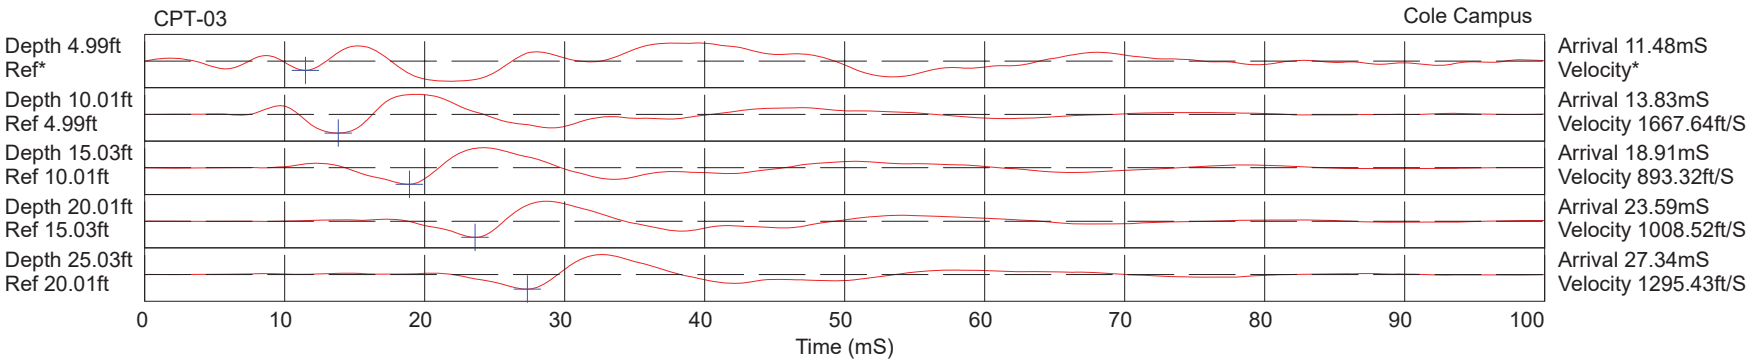
* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.



Middle Earth Geo Testing

Project ID: CEL
Data File: SDF(324).cpt
CPT Date: 11/9/2019 7:51:37 AM
GW During Test: 14 ft

Sounding ID: CPT-03

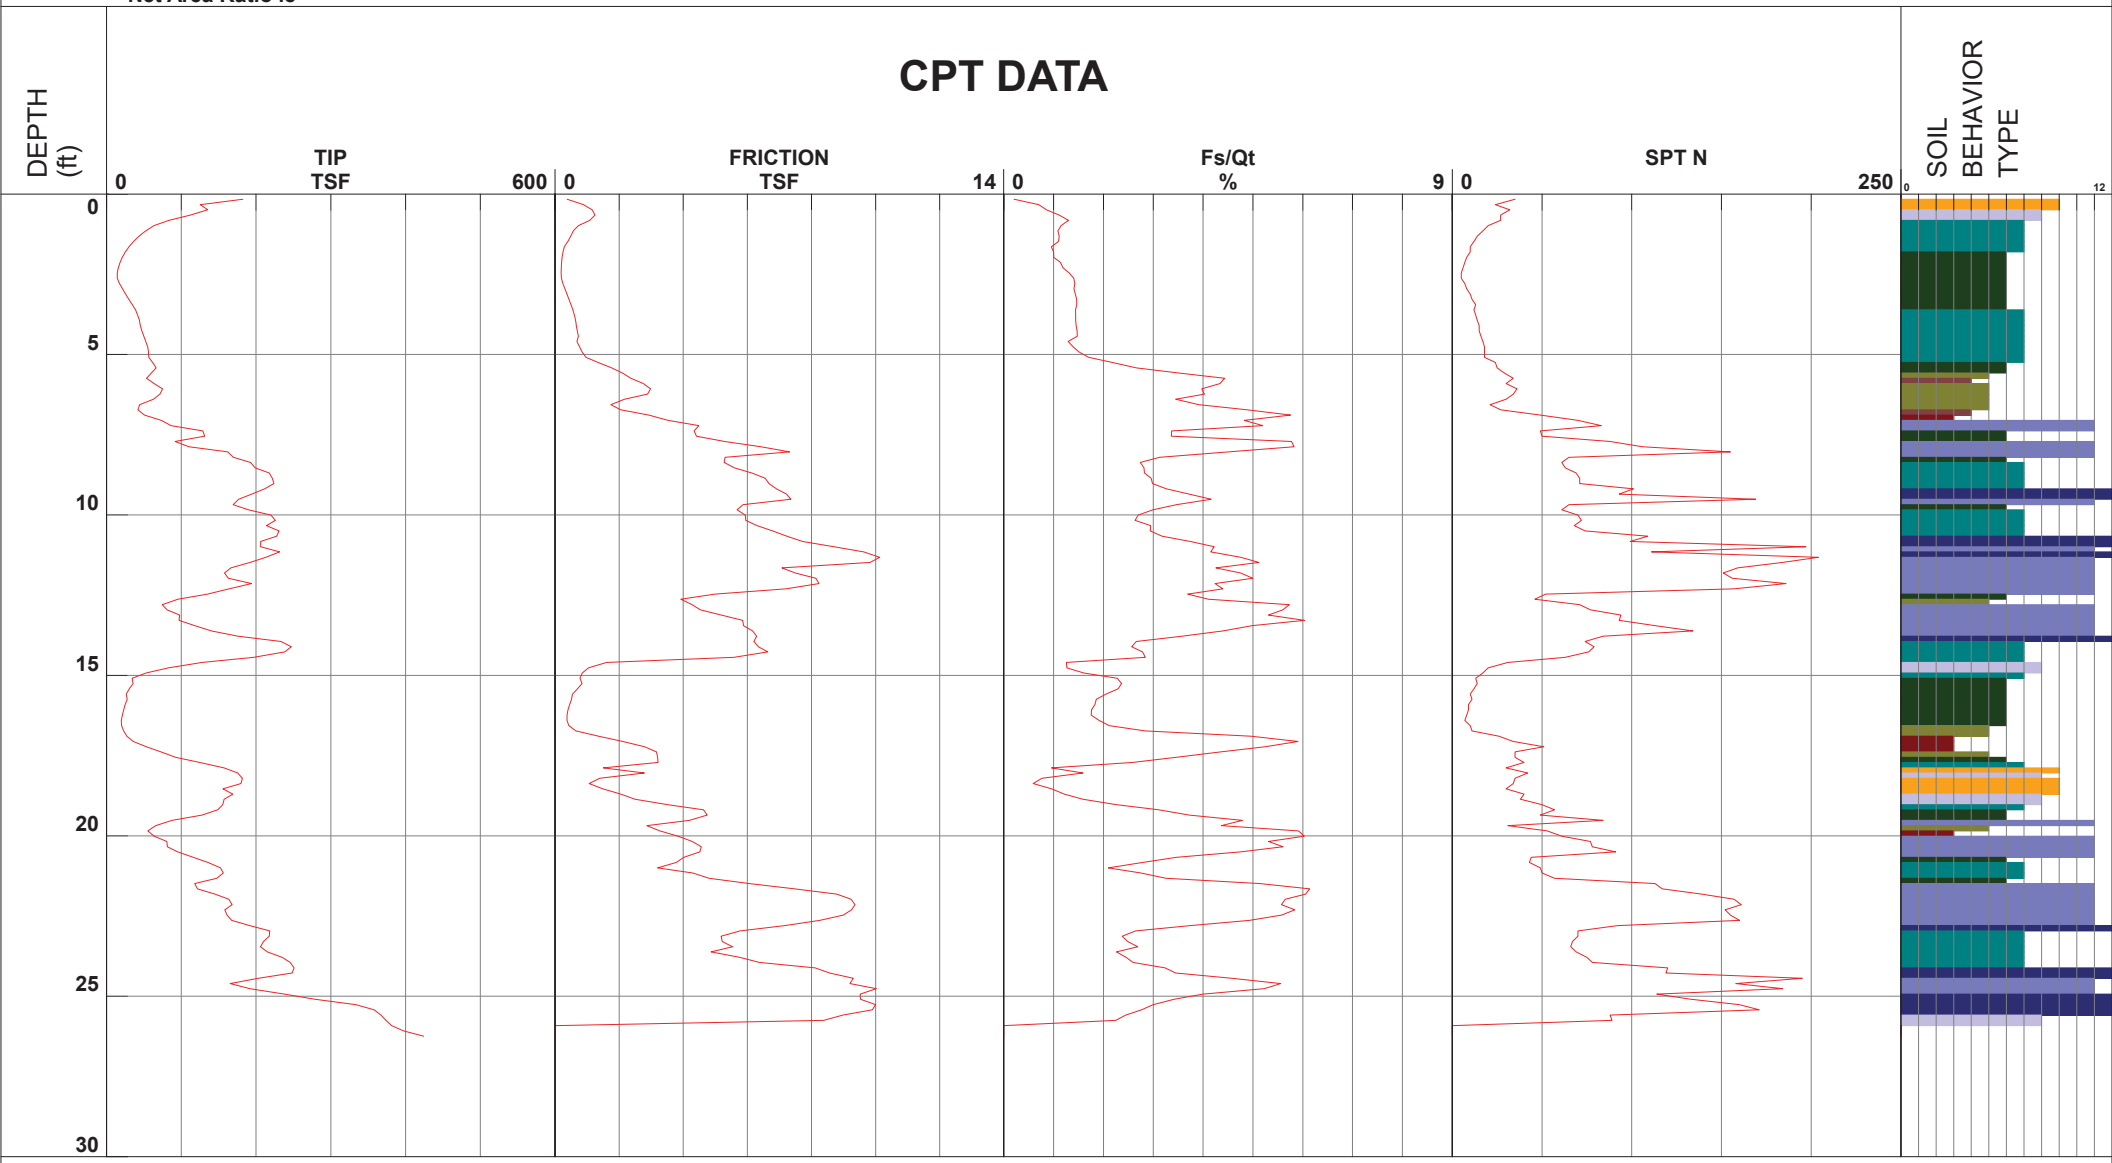
* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Hammer to Rod String Distance (ft): 5.83
* = Not Determined

COMMENT:



Middle Earth
Geo Testing Inc.

CEL

Project	Cole Campus	Operator	JM-AJ	Filename	SDF(327).cpt
Job Number	84-04726-PW	Cone Number	DDG1489	GPS	
Hole Number	CPT-04	Date and Time	11/9/2019 10:51:04 AM	Maximum Depth	26.25 ft
EST GW Depth During Test		13.00 ft			

Net Area Ratio .8

CPT DATA

1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

Cole Campus

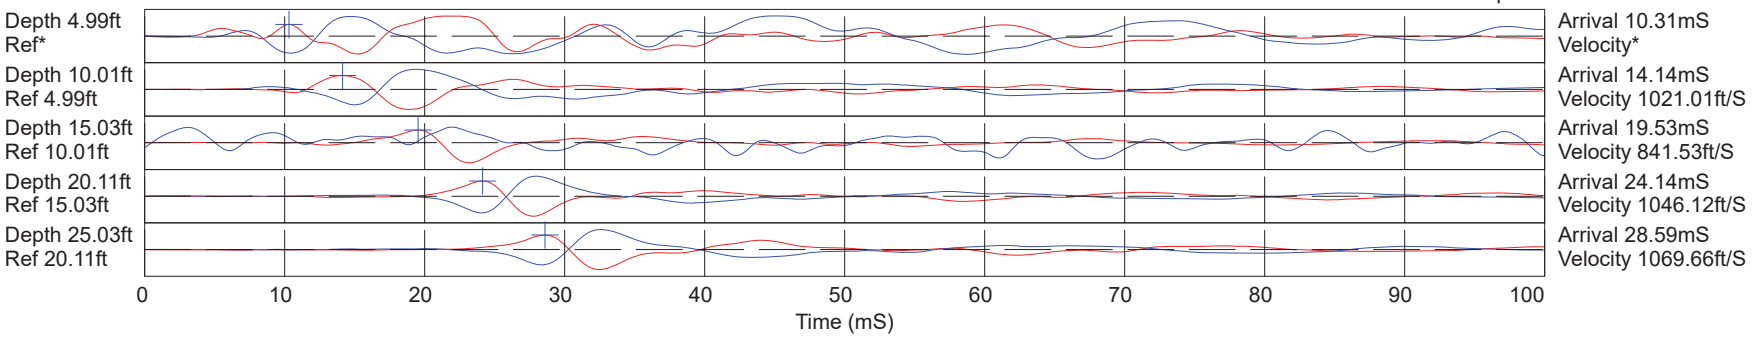
* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing



Project ID: CEL
Data File: SDF(327).cpt
CPT Date: 11/9/2019 10:51:04 AM
GW During Test: 13 ft

Sounding ID: CPT-04
Project No: 84-04726-PW
Cone/Rig: DDG1489

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

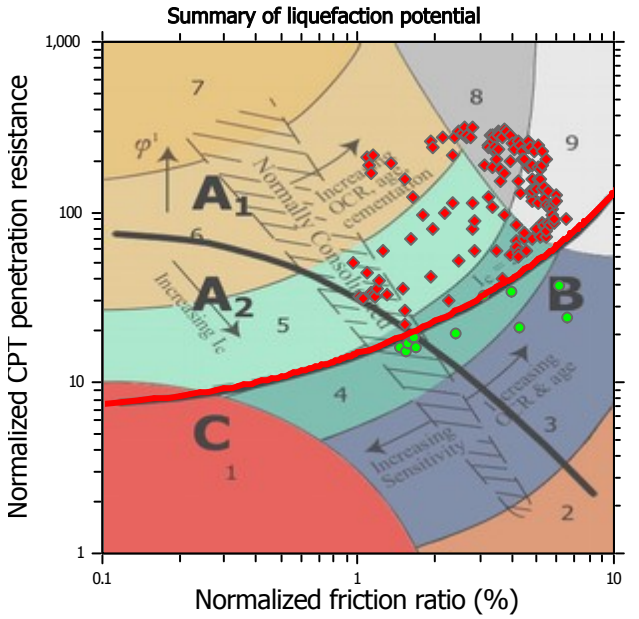
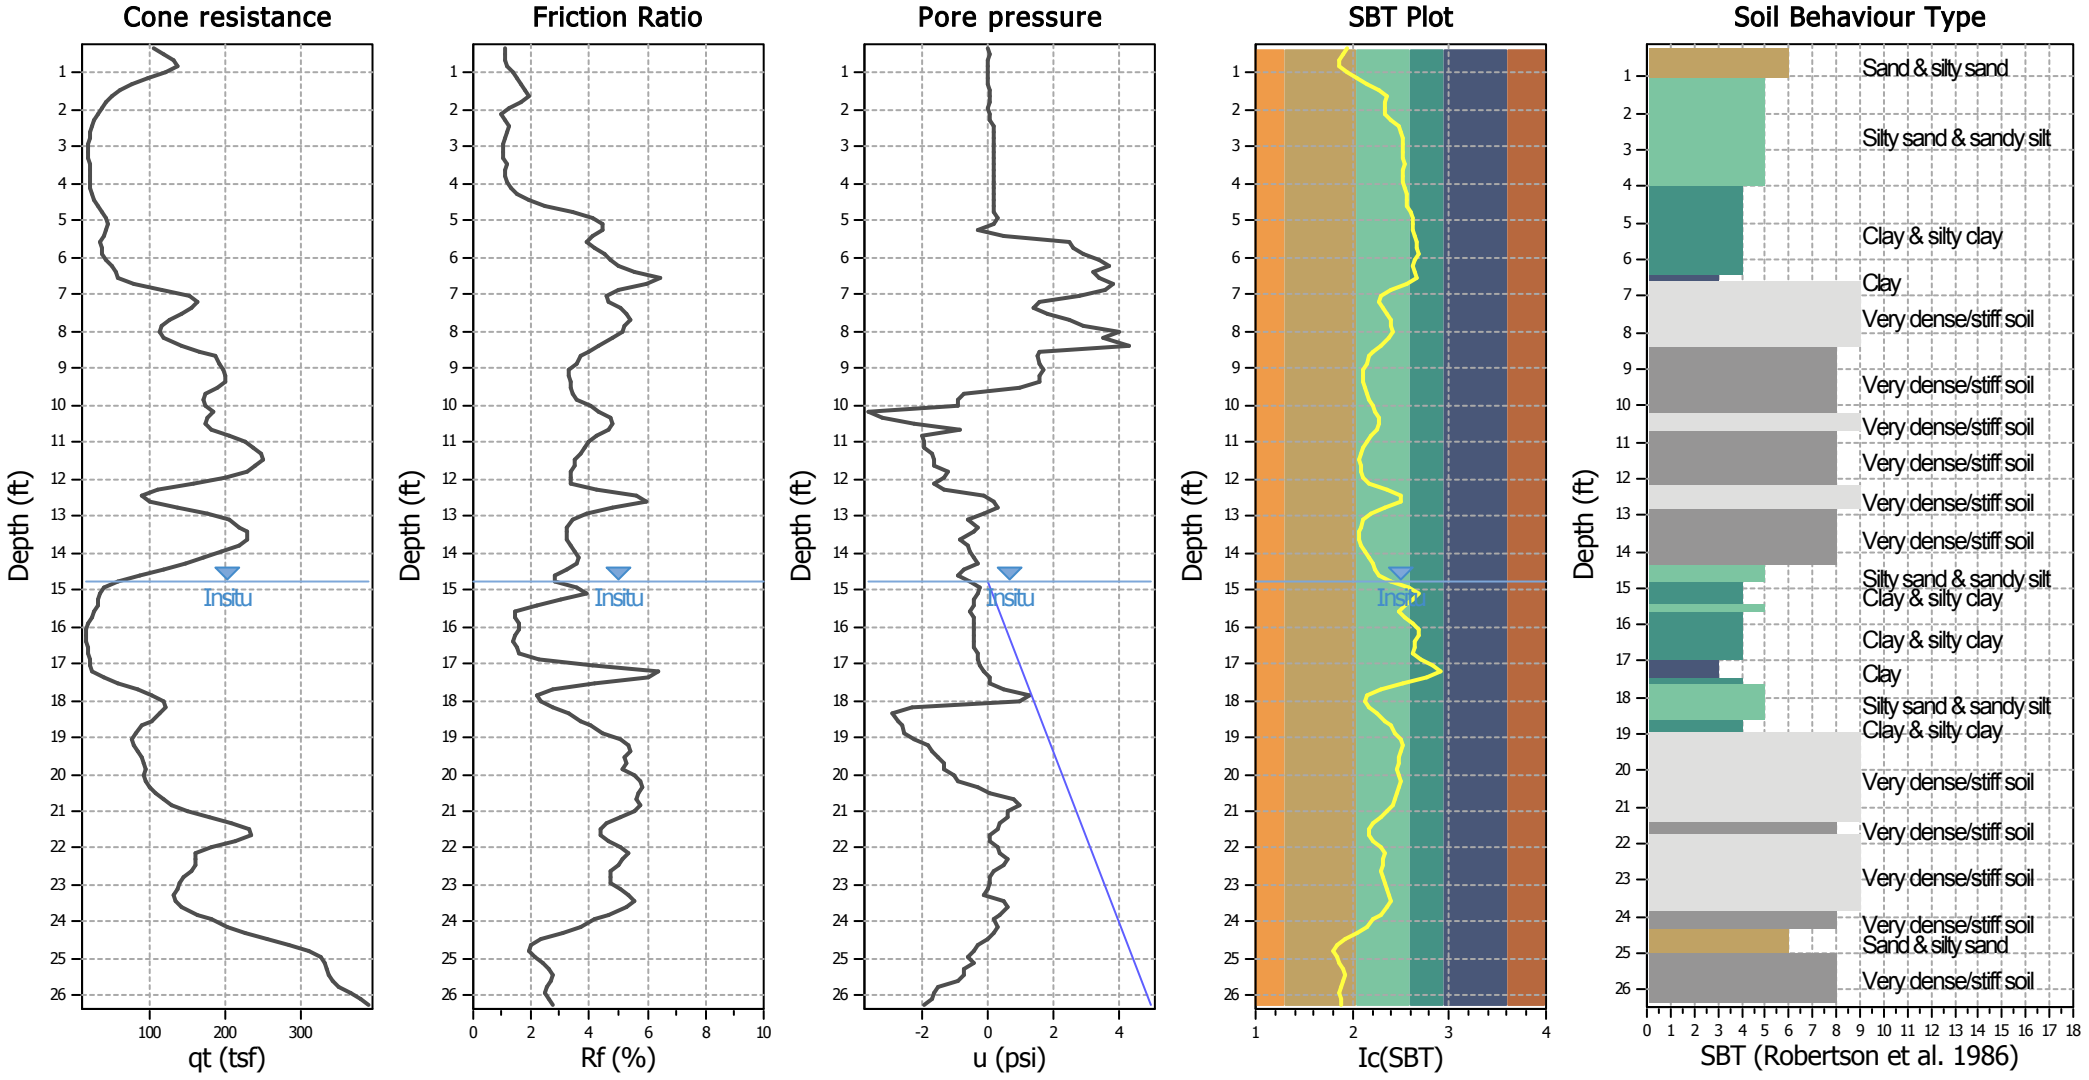
LIQUEFACTION ANALYSIS REPORT



Project title : Cole CampusCole Campus – Central **Location : Oakland**
CPT file : CPT-01

Input parameters and analysis data

Analysis method:	**NCEER (1998)**	**G.W.T. (in-situ):**	**14.80 ft**	**Use fill:**	**No**	**Clay like behavior applied:**	**Sands only**
Fines correction method:	**NCEER (1998)**	**G.W.T. (earthq.):**	**12.00 ft**	**Fill height:**	**N/A**	**Limit depth applie**	**No**
Points to test:	**Based on Ic value**	**Average results interva**	**3**	**Fill weight:**	**N/A**	**Limit depth:**	**N/A**
Earthquake magnitude M_w:	**6.90**	**Ic cut-off value:**	**2.60**	**Trans. detect. applied:**	**No**	**MSF method:**	**Method based**
Peak ground acceleration:	**0.70**	**Unit weight calculatior**	**Based on SBT**	**K_o applied:**	**Yes**		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Abbreviations

Q_{tn}: Equivalent clean sand normalized cone resistance
K_c: Fines correction factor
$Q_{tn,cs}$: Post-liquefaction volumentric strain
G_{max}: Small strain shear modulus
CSR: Soil cyclic stress ratio
γ: Cyclic shear strain
$e_{vol(15)}$: Volumetric strain after 15 cycles
N_c: Equivalent number of cycles
e_v: Volumetric strain
Settle.: Calculated settlement

:: Post-earthquake settlement due to soil liquefaction ::

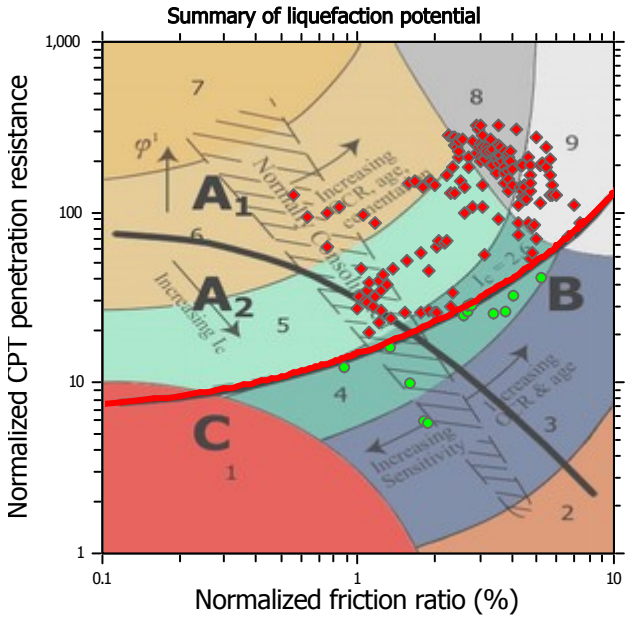
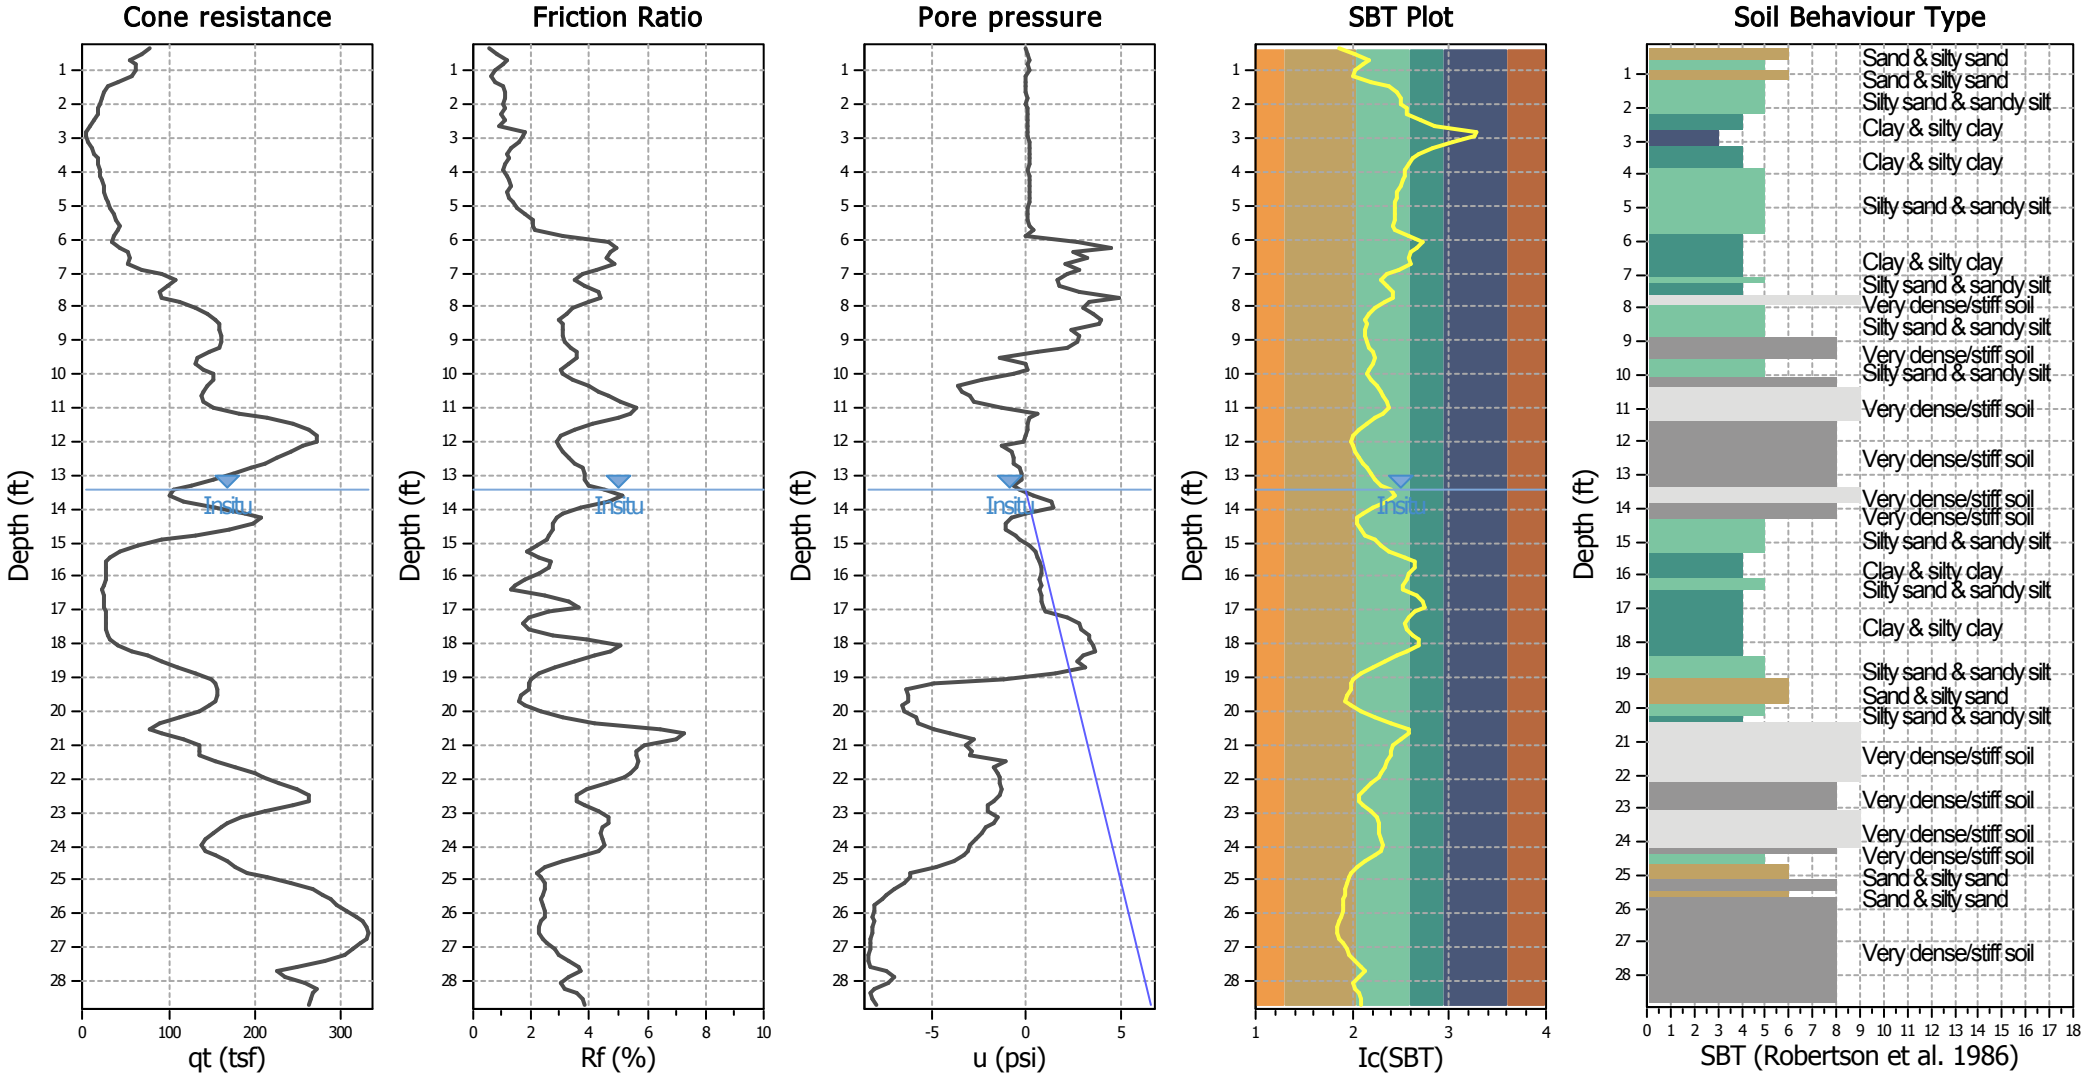
LIQUEFACTION ANALYSIS REPORT



Project title : Cole CampusCole Campus – Central **Location : Oakland**
CPT file : CPT-02

Input parameters and analysis data

Analysis method:	**NCEER (1998)**	**G.W.T. (in-situ):**	**13.40 ft**	**Use fill:**	**No**	**Clay like behavior applied:**	**Sands only**
Fines correction method:	**NCEER (1998)**	**G.W.T. (earthq.):**	**12.00 ft**	**Fill height:**	**N/A**	**Limit depth applie**	**No**
Points to test:	**Based on Ic value**	**Average results interva**	**3**	**Fill weight:**	**N/A**	**Limit depth:**	**N/A**
Earthquake magnitude M_w:	**6.90**	**Ic cut-off value:**	**2.60**	**Trans. detect. applied:**	**No**	**MSF method:**	**Method based**
Peak ground acceleration:	**0.70**	**Unit weight calculatior**	**Based on SBT**	**K_o applied:**	**Yes**		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots (intermediate results)

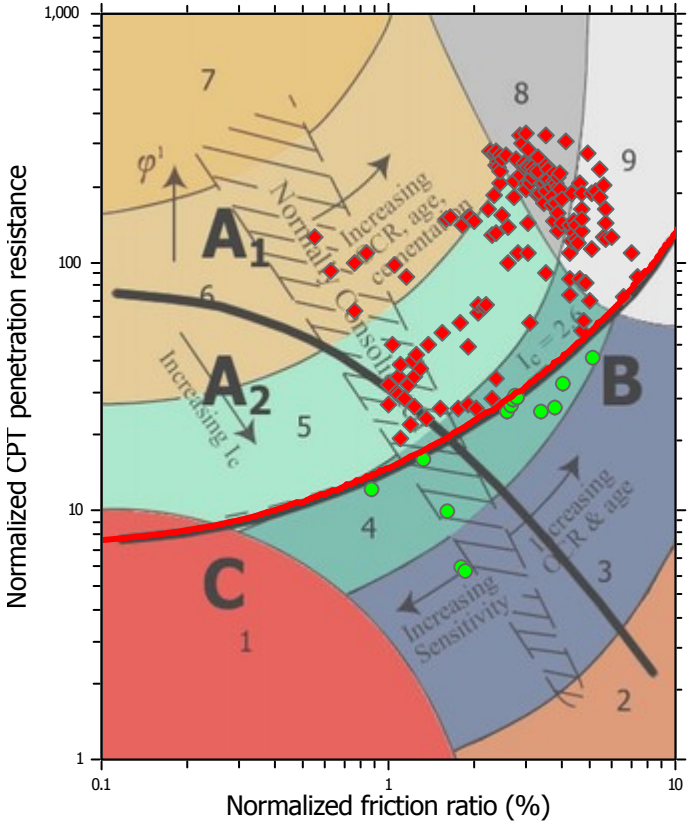
Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_o applied:	Yes
Earthquake magnitude M_w:	6.90	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.70	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	13.40 ft	Fill height:	N/A	Limit depth:	N/A

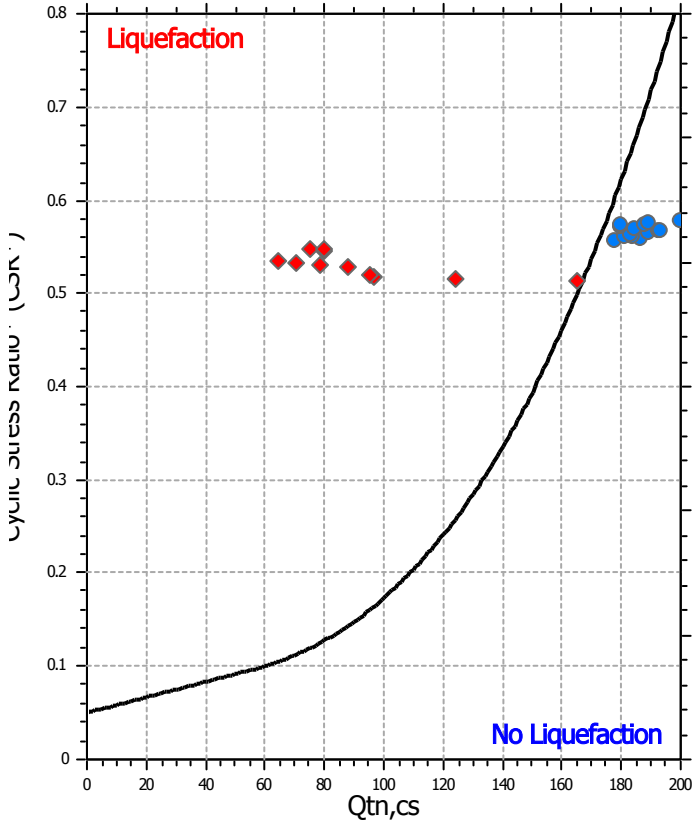
Liquefaction analysis overall plots

Input parameters and analysis data

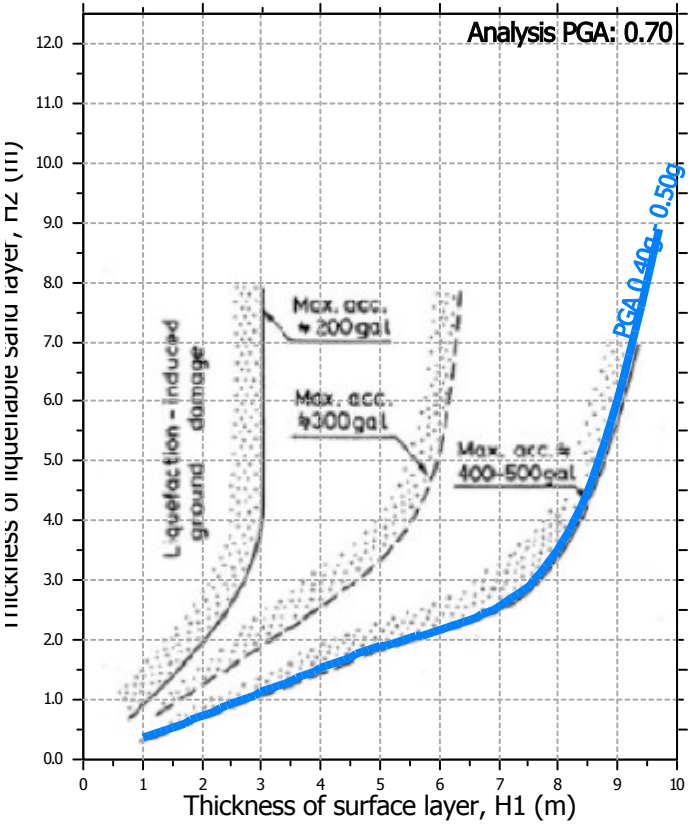
Analysis method:	NCEER (1998)	Depth to water table (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.90	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.70	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	13.40 ft	Fill height:	N/A	Limit depth:	N/A



F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Liquefaction analysis summary plots

Abbreviations

Q_{tn}: Equivalent clean sand normalized cone resistance
K_c: Fines correction factor
$Q_{tn,cs}$: Post-liquefaction volumentric strain
G_{max}: Small strain shear modulus
CSR: Soil cyclic stress ratio
γ: Cyclic shear strain
$e_{vol(15)}$: Volumetric strain after 15 cycles
N_c: Equivalent number of cycles
e_v: Volumetric strain
Settle.: Calculated settlement

:: Post-earthquake settlement due to soil liquefaction ::

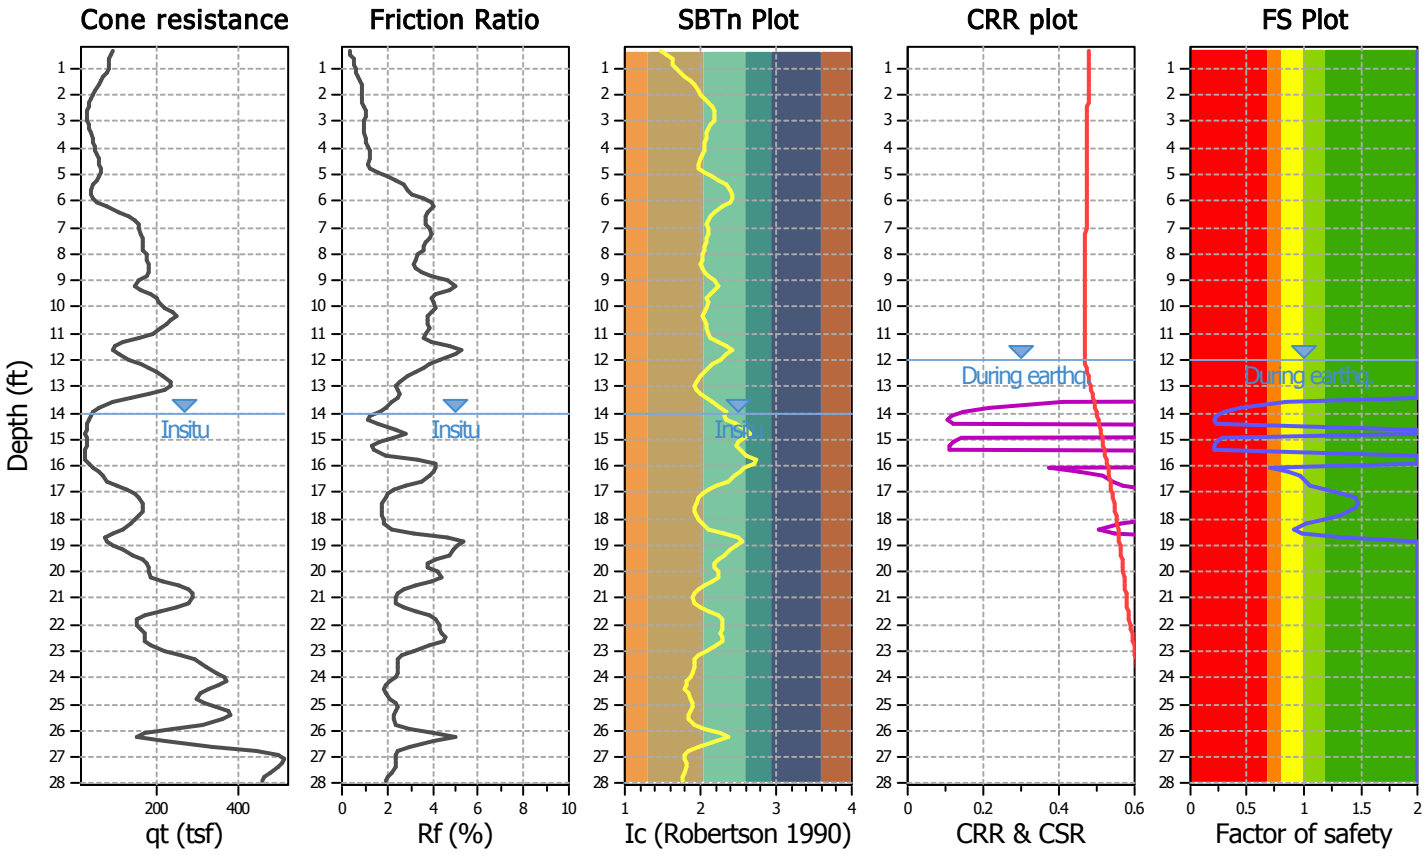
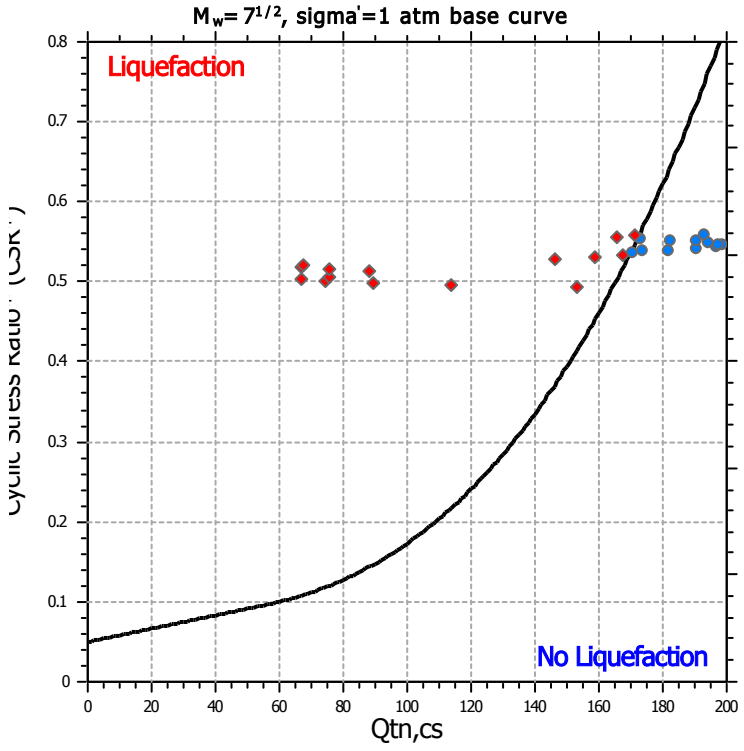
Total estimated settlement: 0.62

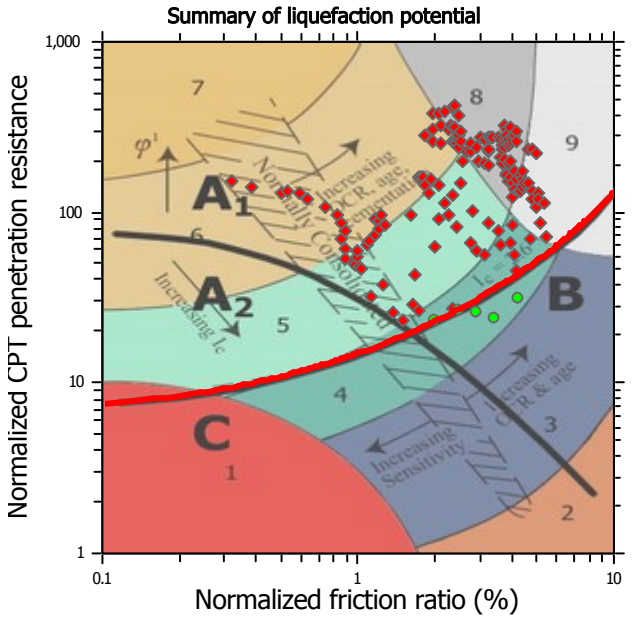
Abbreviations



$Q_{tn,cs}$:	Equivalent clean sand normalized cone resistance
FS:	Factor of safety against liquefaction
e_v (%):	Post-liquefaction volumentric strain
DF:	e_v depth weighting factor
Settlement:	Calculated settlement



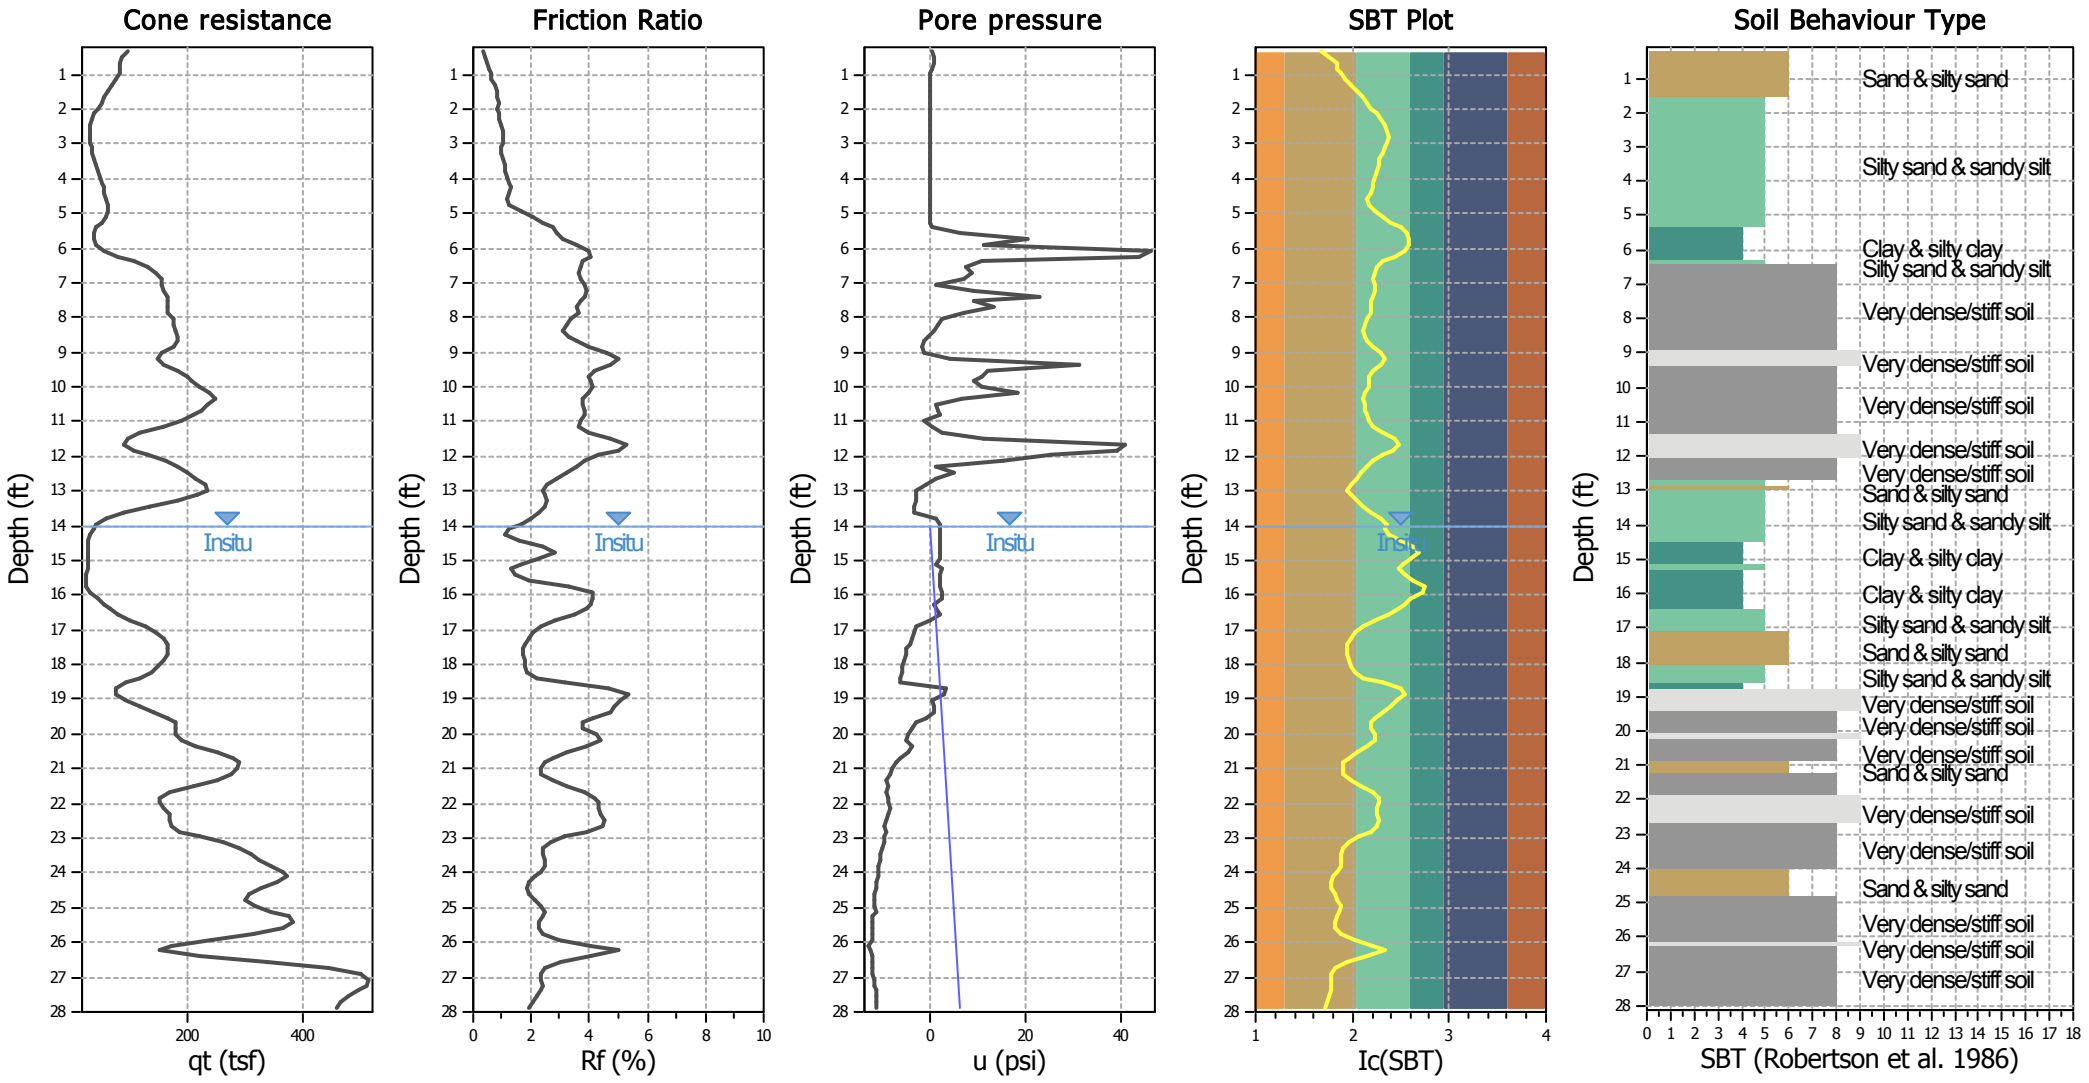
LIQUEFACTION ANALYSIS REPORT



Project title : Cole CampusCole Campus – Central **Location : Oakland**
CPT file : CPT-03

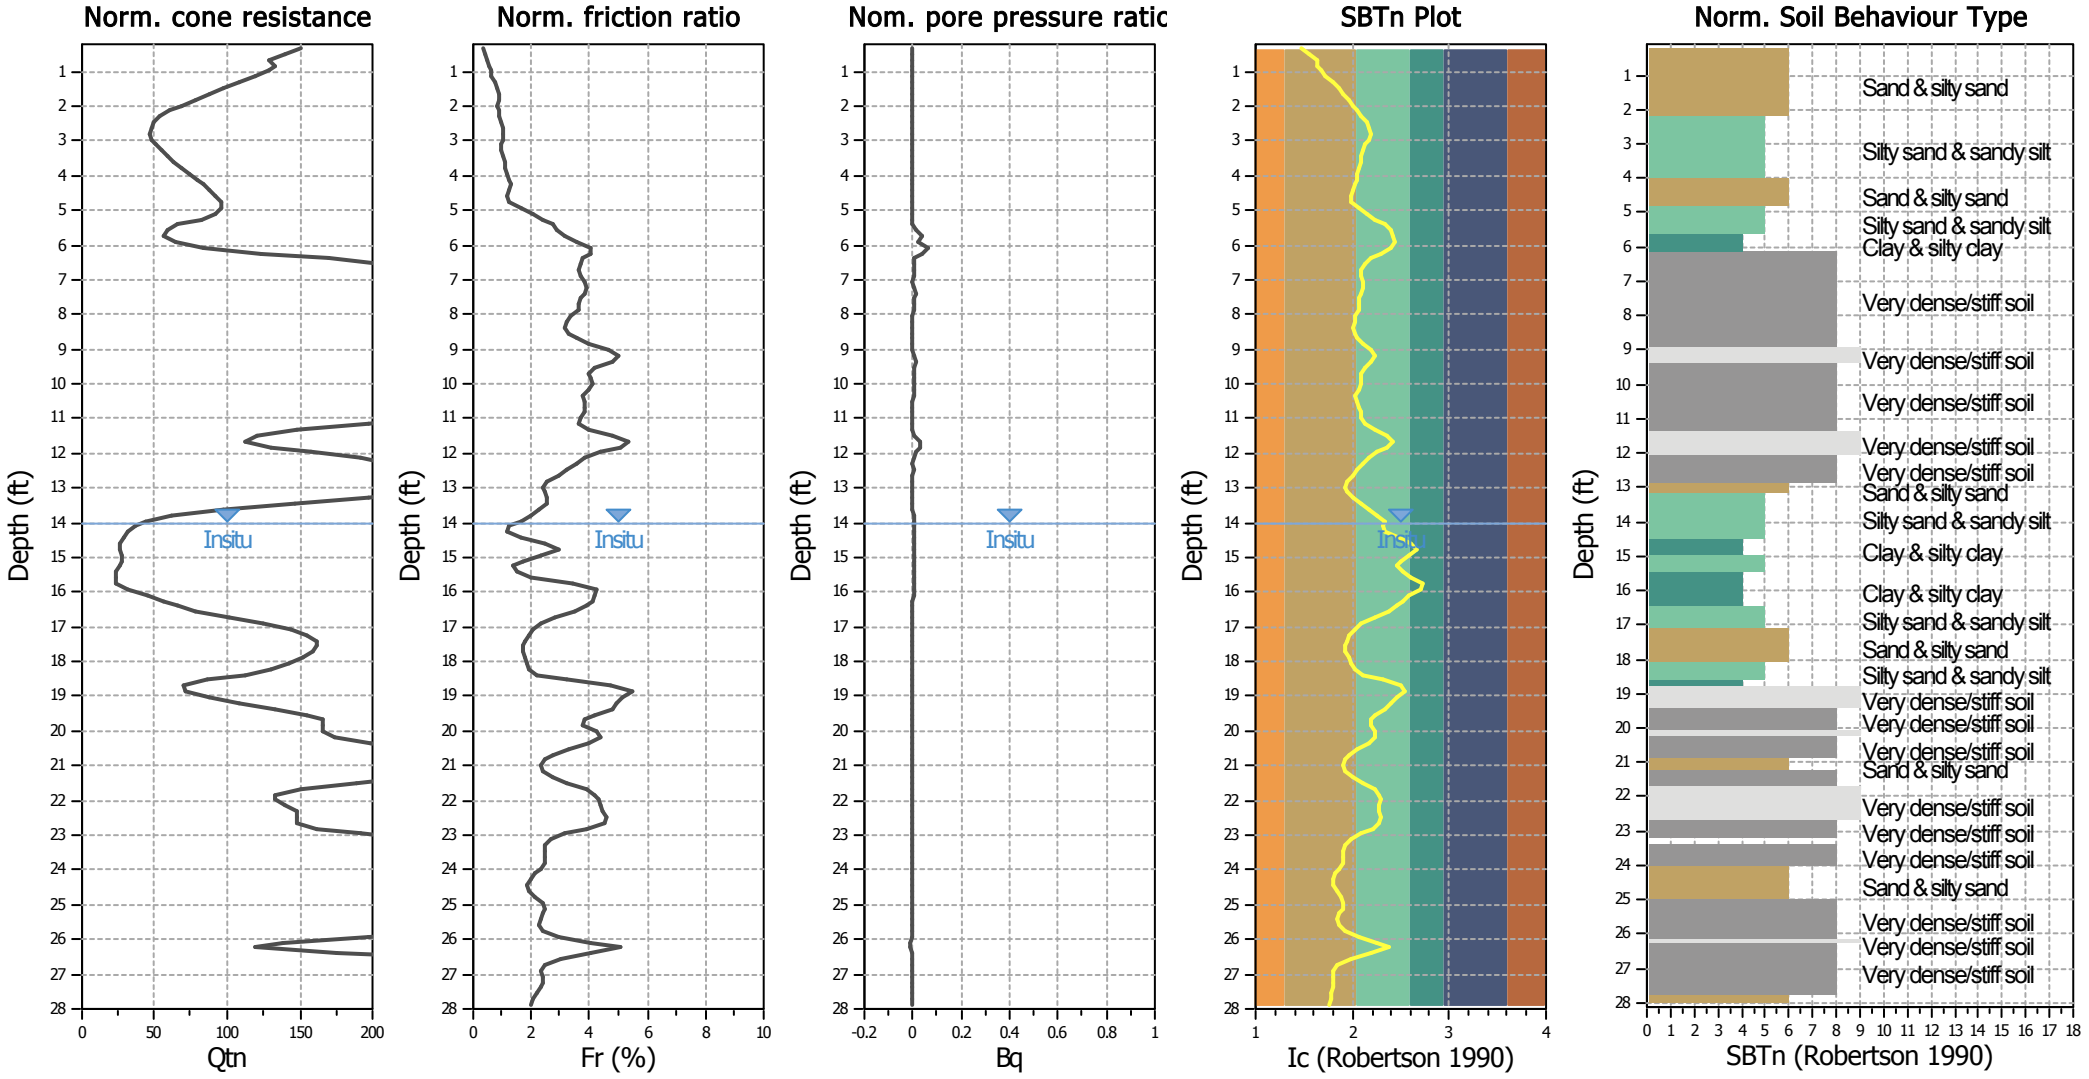
Input parameters and analysis data

Analysis method:	**NCEER (1998)**	**G.W.T. (in-situ):**	**14.00 ft**	**Use fill:**	**No**	**Clay like behavior applied:**	**Sands only**
Fines correction method:	**NCEER (1998)**	**G.W.T. (earthq.):**	**12.00 ft**	**Fill height:**	**N/A**	**Limit depth applie**	**No**
Points to test:	**Based on Ic value**	**Average results interva**	**3**	**Fill weight:**	**N/A**	**Limit depth:**	**N/A**
Earthquake magnitude M_w:	**6.90**	**Ic cut-off value:**	**2.60**	**Trans. detect. applied:**	**No**	**MSF method:**	**Method based**
Peak ground acceleration:	**0.70**	**Unit weight calculatior**	**Based on SBT**	**K_o applied:**	**Yes**		



Zone A_1 : Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.90	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.70	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	14.00 ft	Fill height:	N/A	Limit depth:	N/A

SBT legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

CPT basic interpretation plots (normalized)

Peak ground acceleration:	0.70	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	14.00 ft	Fill height:	N/A	Limit depth:	N/A

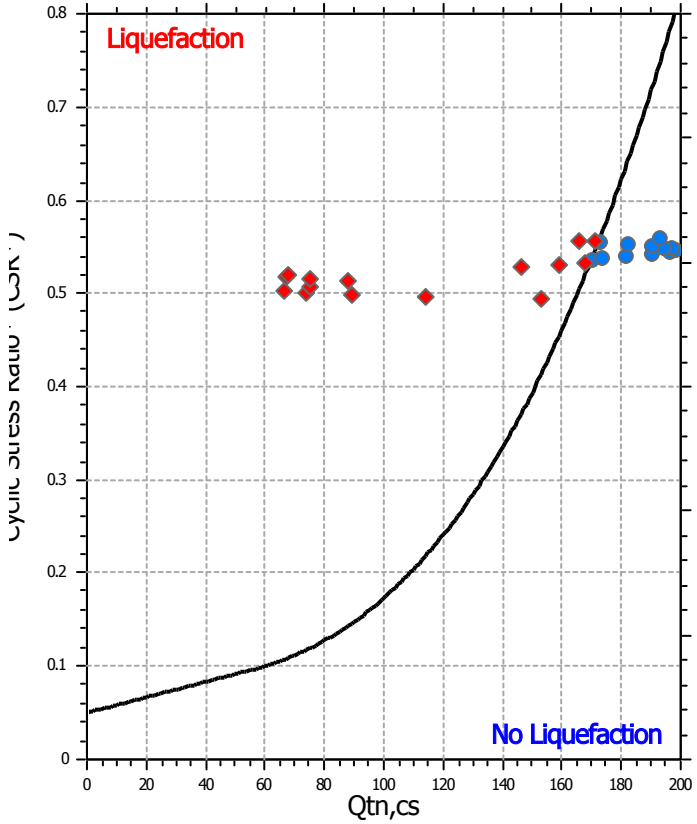
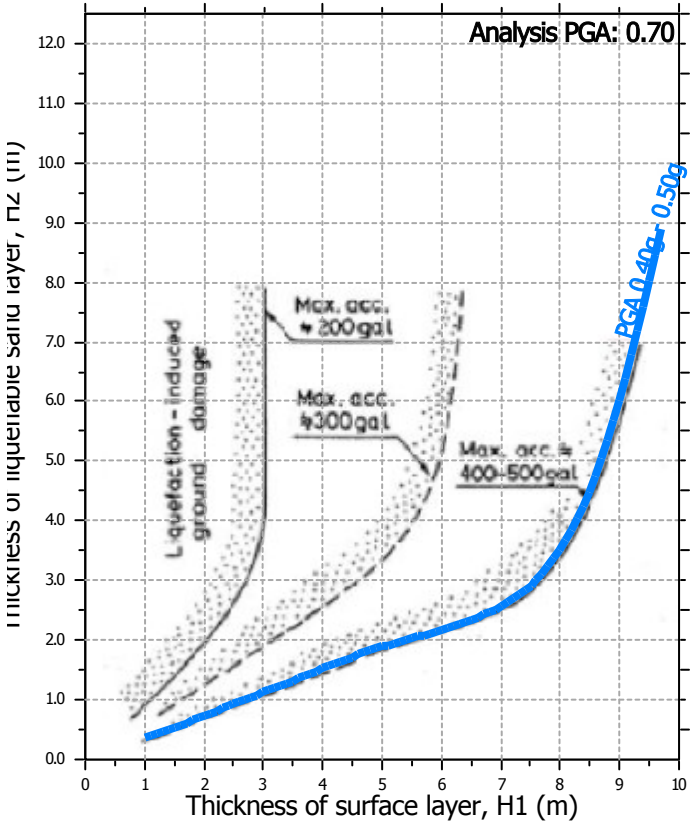
F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Liquefaction analysis summary plots

Abbreviations

Q_{tn}: Equivalent clean sand normalized cone resistance
K_c: Fines correction factor
$Q_{tn,cs}$: Post-liquefaction volumentric strain
G_{max}: Small strain shear modulus
CSR: Soil cyclic stress ratio
γ: Cyclic shear strain
$e_{vol(15)}$: Volumetric strain after 15 cycles
N_c: Equivalent number of cycles
e_v: Volumetric strain
Settle.: Calculated settlement

:: Post-earthquake settlement due to soil liquefaction ::

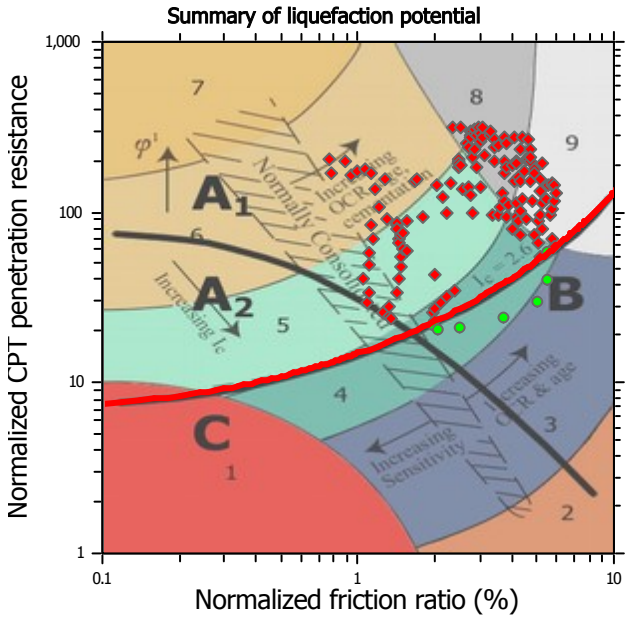
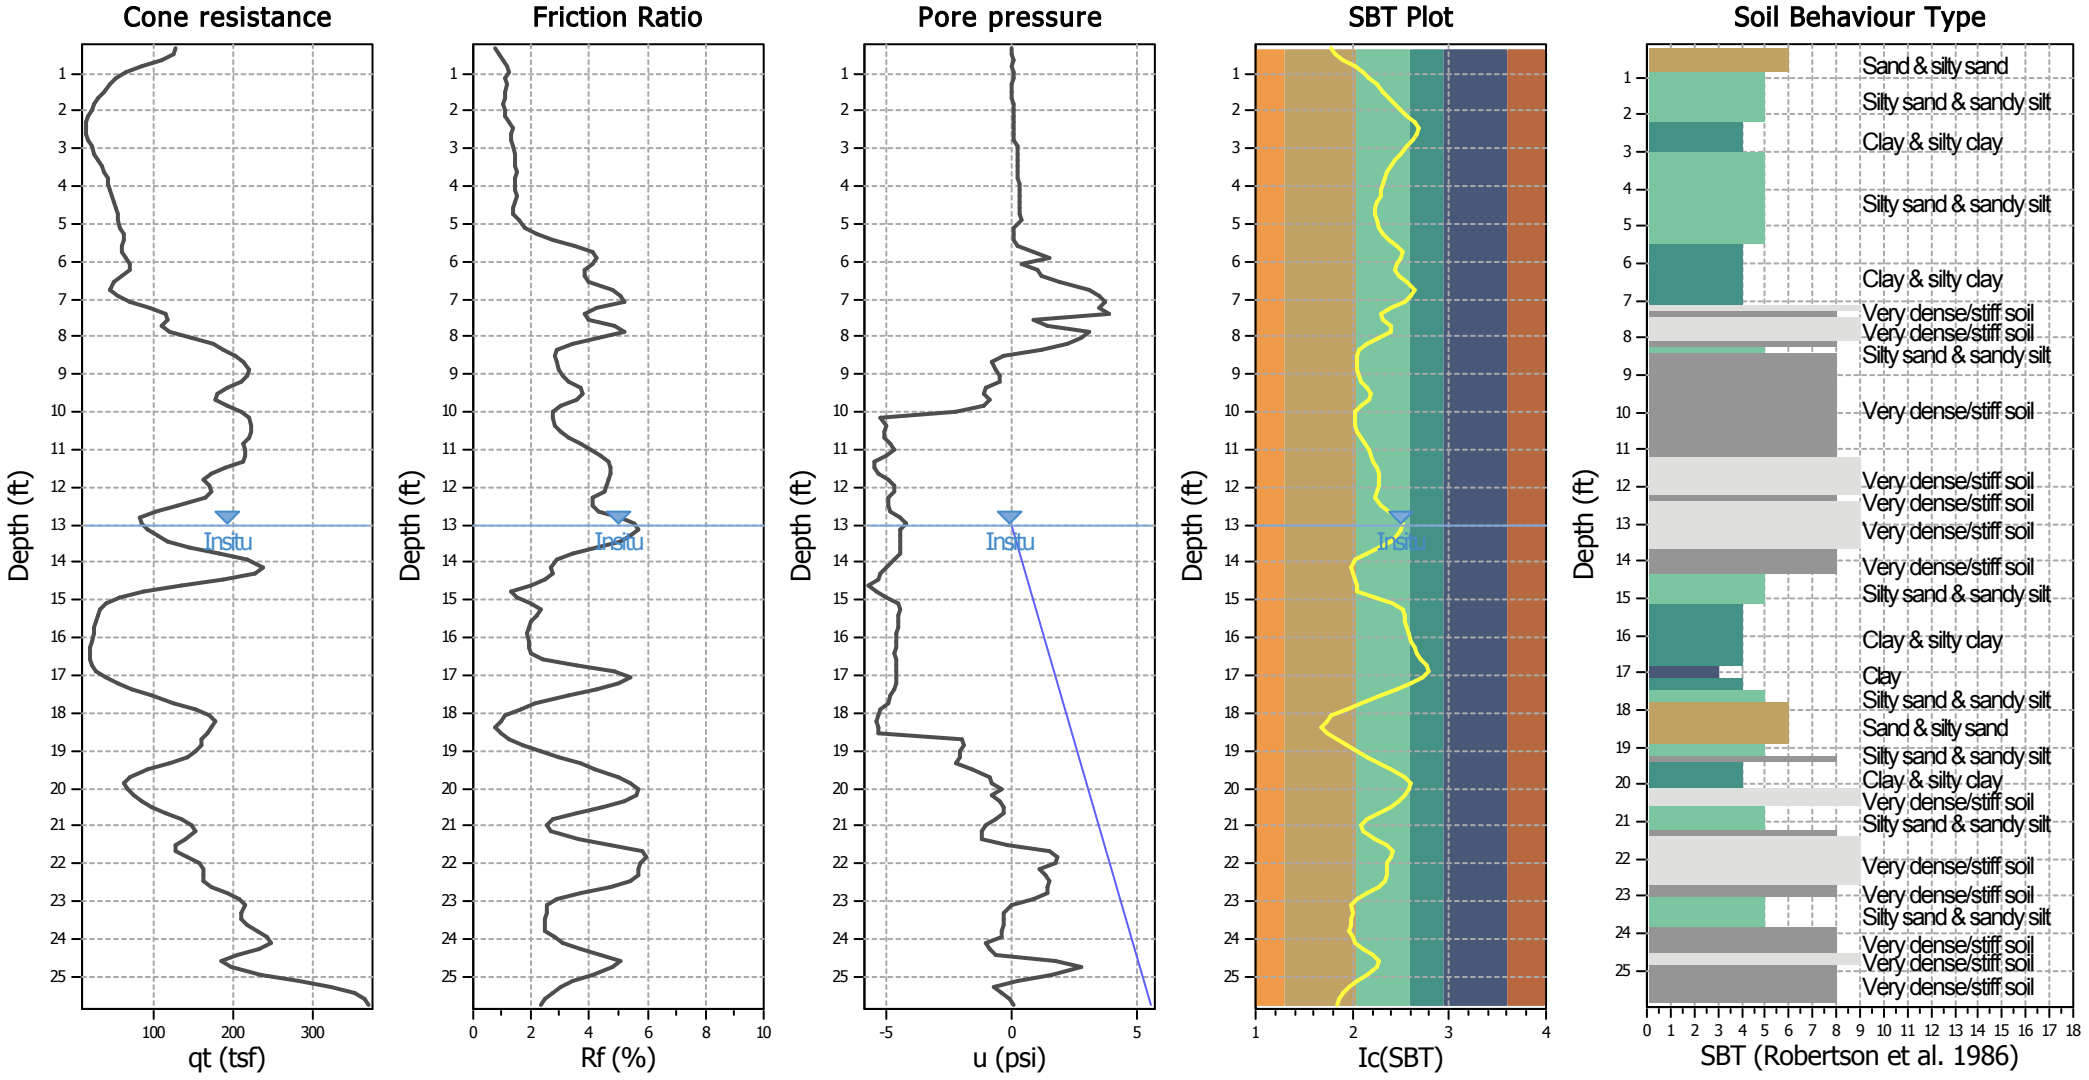
LIQUEFACTION ANALYSIS REPORT



Project title : Cole CampusCole Campus – Central **Location : Oakland**
CPT file : CPT-04

Input parameters and analysis data

Analysis method:	NCEER (1998)	**G.W.T. (in-situ):**	13.00 ft	**Use fill:**	No	**Clay like behavior**	
Fines correction method:	NCEER (1998)	**G.W.T. (earthq.):**	12.00 ft	**Fill height:**	N/A	**applied:**	Sands only
Points to test:	Based on Ic value	**Average results interva**	3	**Fill weight:**	N/A	**Limit depth applie**	No
Earthquake magnitude M_w:	6.90	**Ic cut-off value:**	2.60	**Trans. detect. applied:**	No	**Limit depth:**	N/A
Peak ground acceleration:	0.70	**Unit weight calculatior**	Based on SBT	**K_o applied:**	Yes	**MSF method:**	Method based



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots

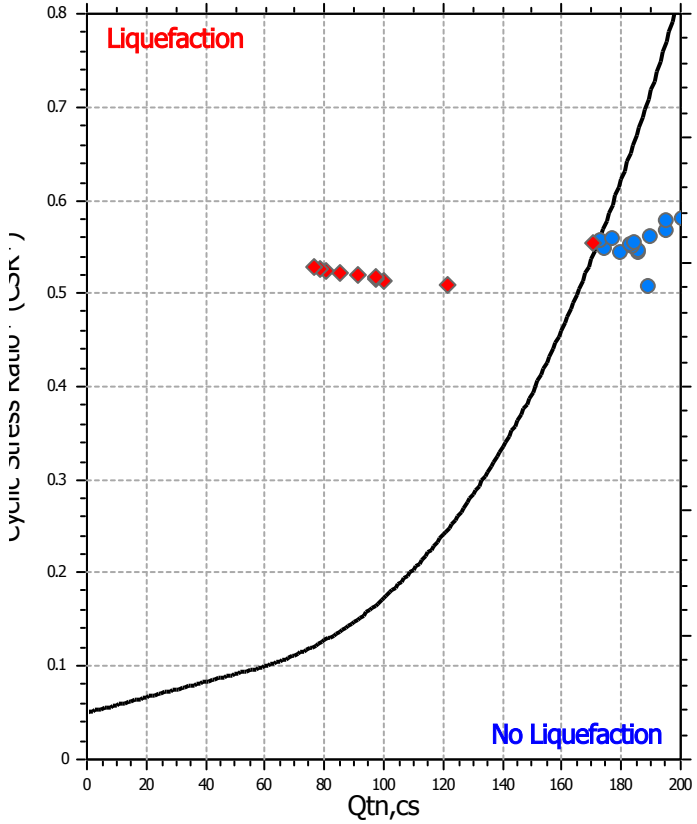
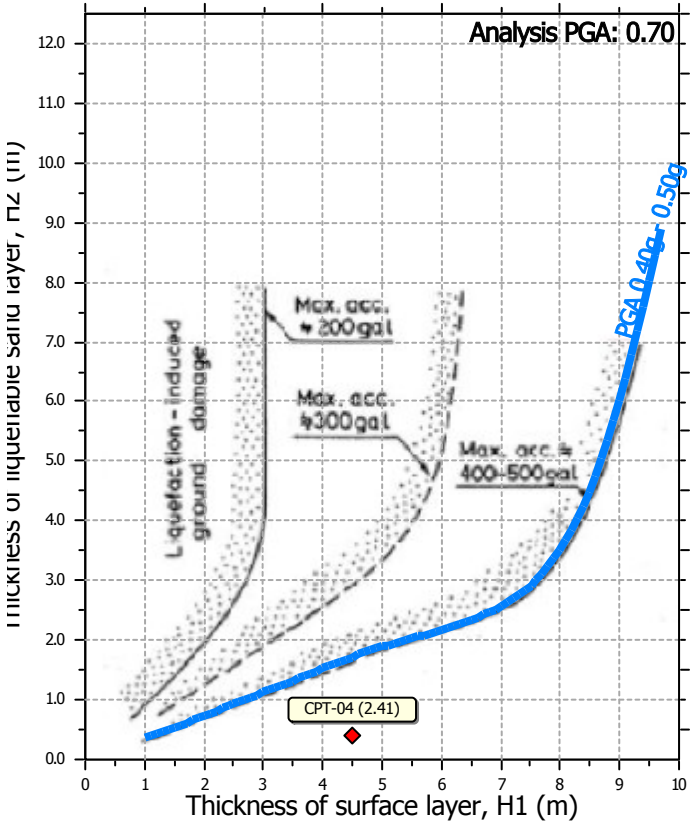
F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Abbreviations

Q_{tn}: Equivalent clean sand normalized cone resistance
K_c: Fines correction factor
$Q_{tn,cs}$: Post-liquefaction volumentric strain
G_{max}: Small strain shear modulus
CSR: Soil cyclic stress ratio
γ: Cyclic shear strain
$e_{vol(15)}$: Volumetric strain after 15 cycles
N_c: Equivalent number of cycles
e_v: Volumetric strain
Settle.: Calculated settlement

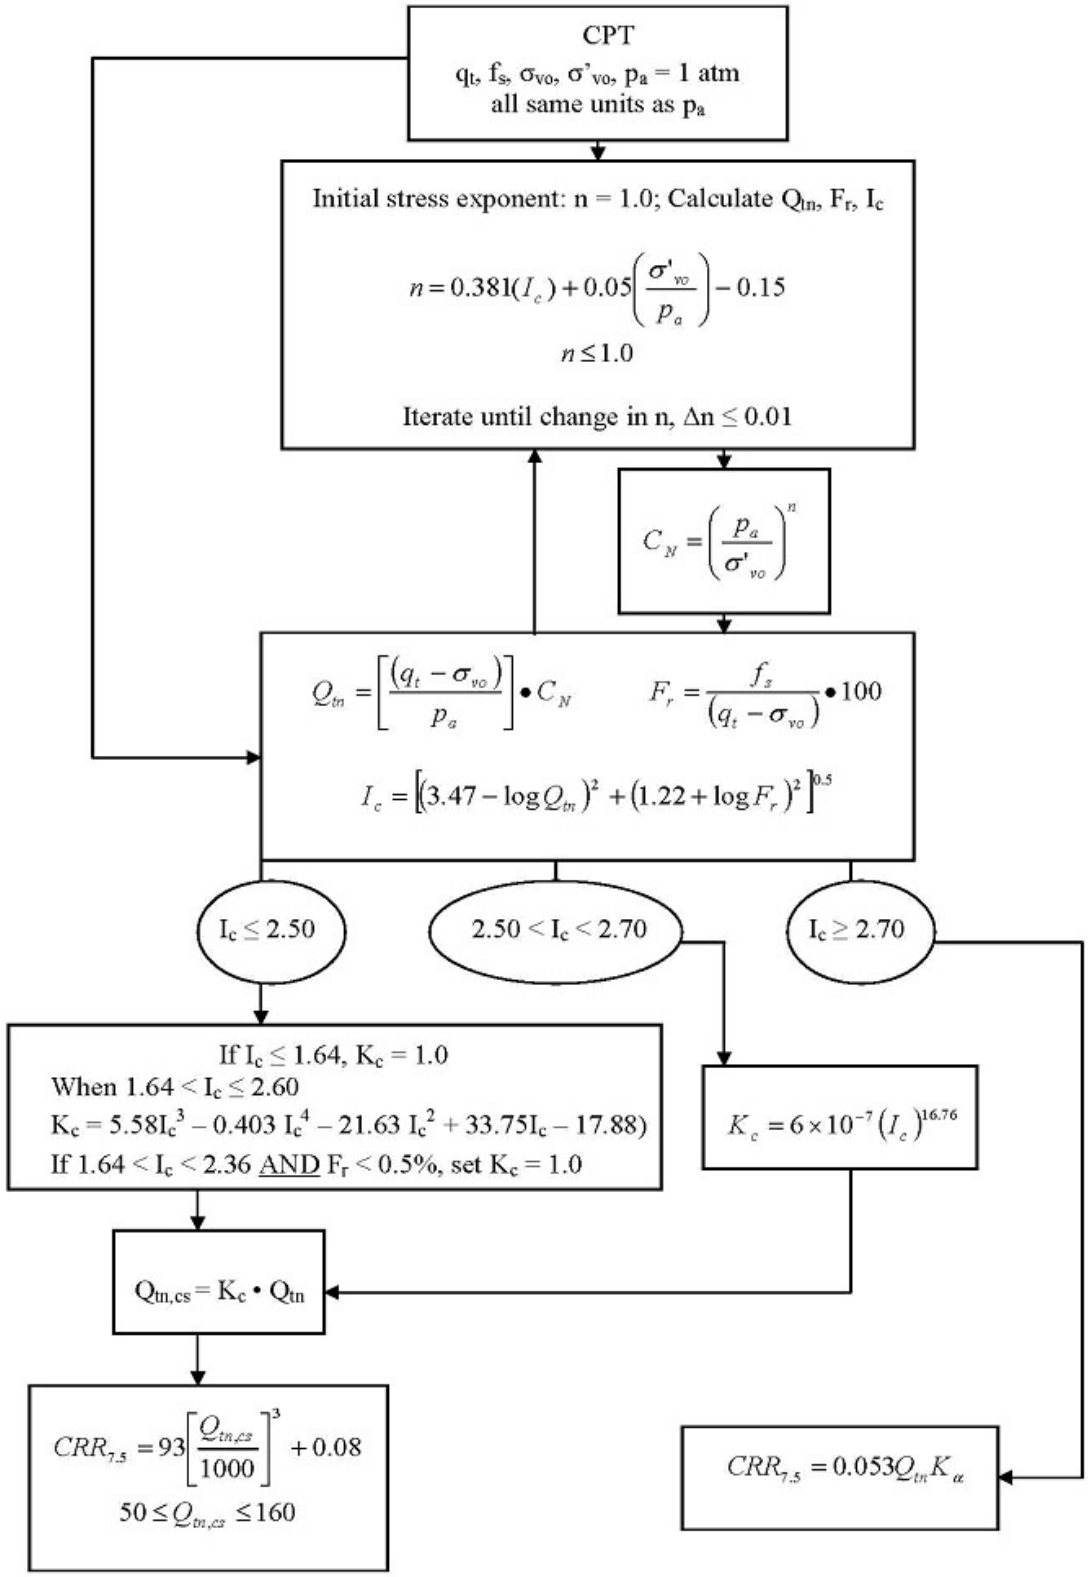
Total estimated settlement: 0.53

Abbreviations

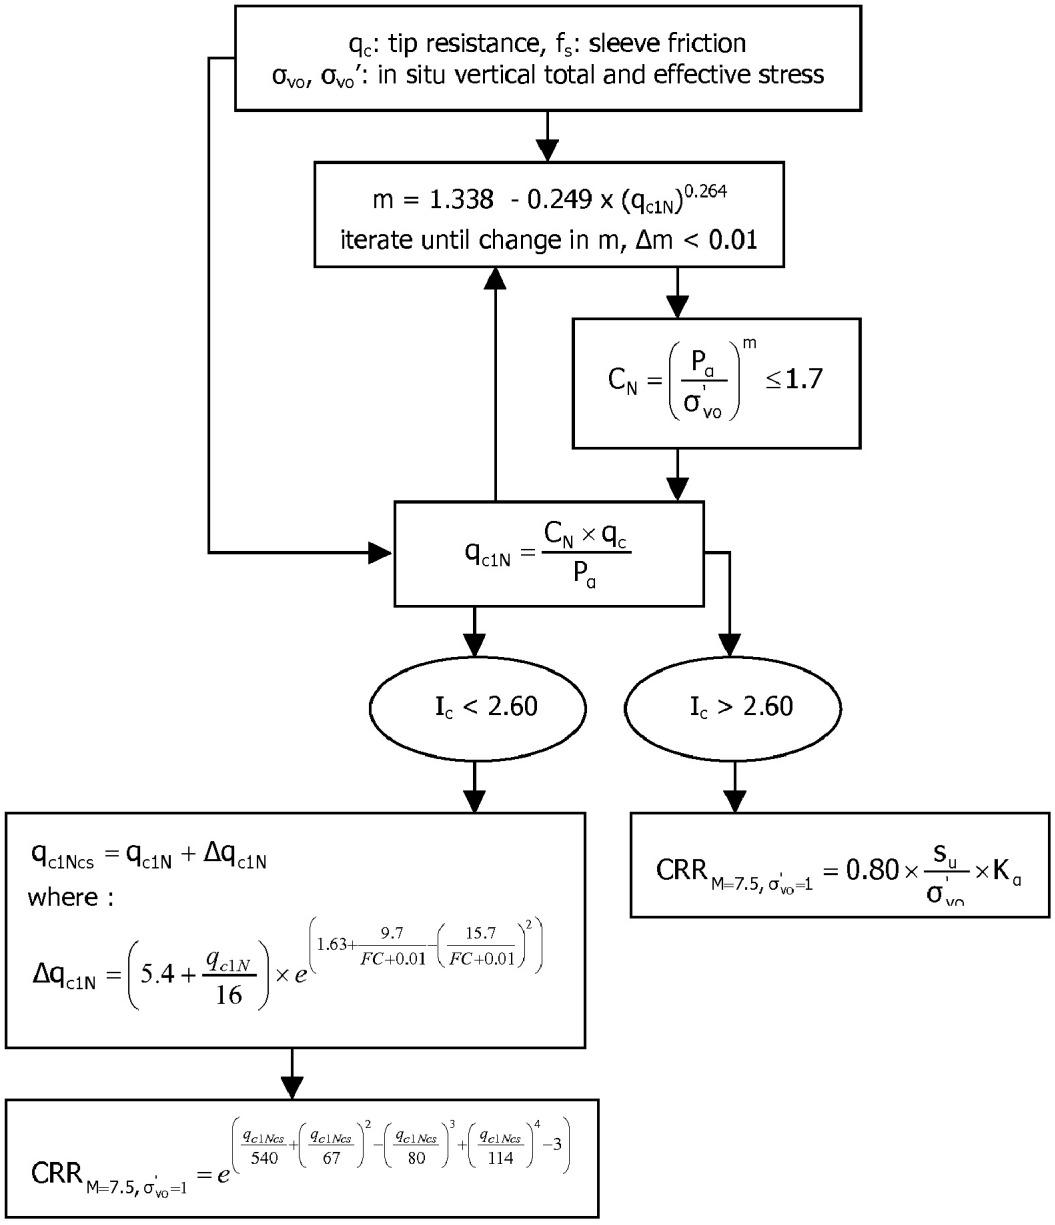
$Q_{tn,cs}$:	Equivalent clean sand normalized cone resistance
FS:	Factor of safety against liquefaction
e_v (%):	Post-liquefaction volumentric strain
DF:	e_v depth weighting factor
Settlement:	Calculated settlement

Procedure for the evaluation of soil liquefaction resistance, NCEER (1998)



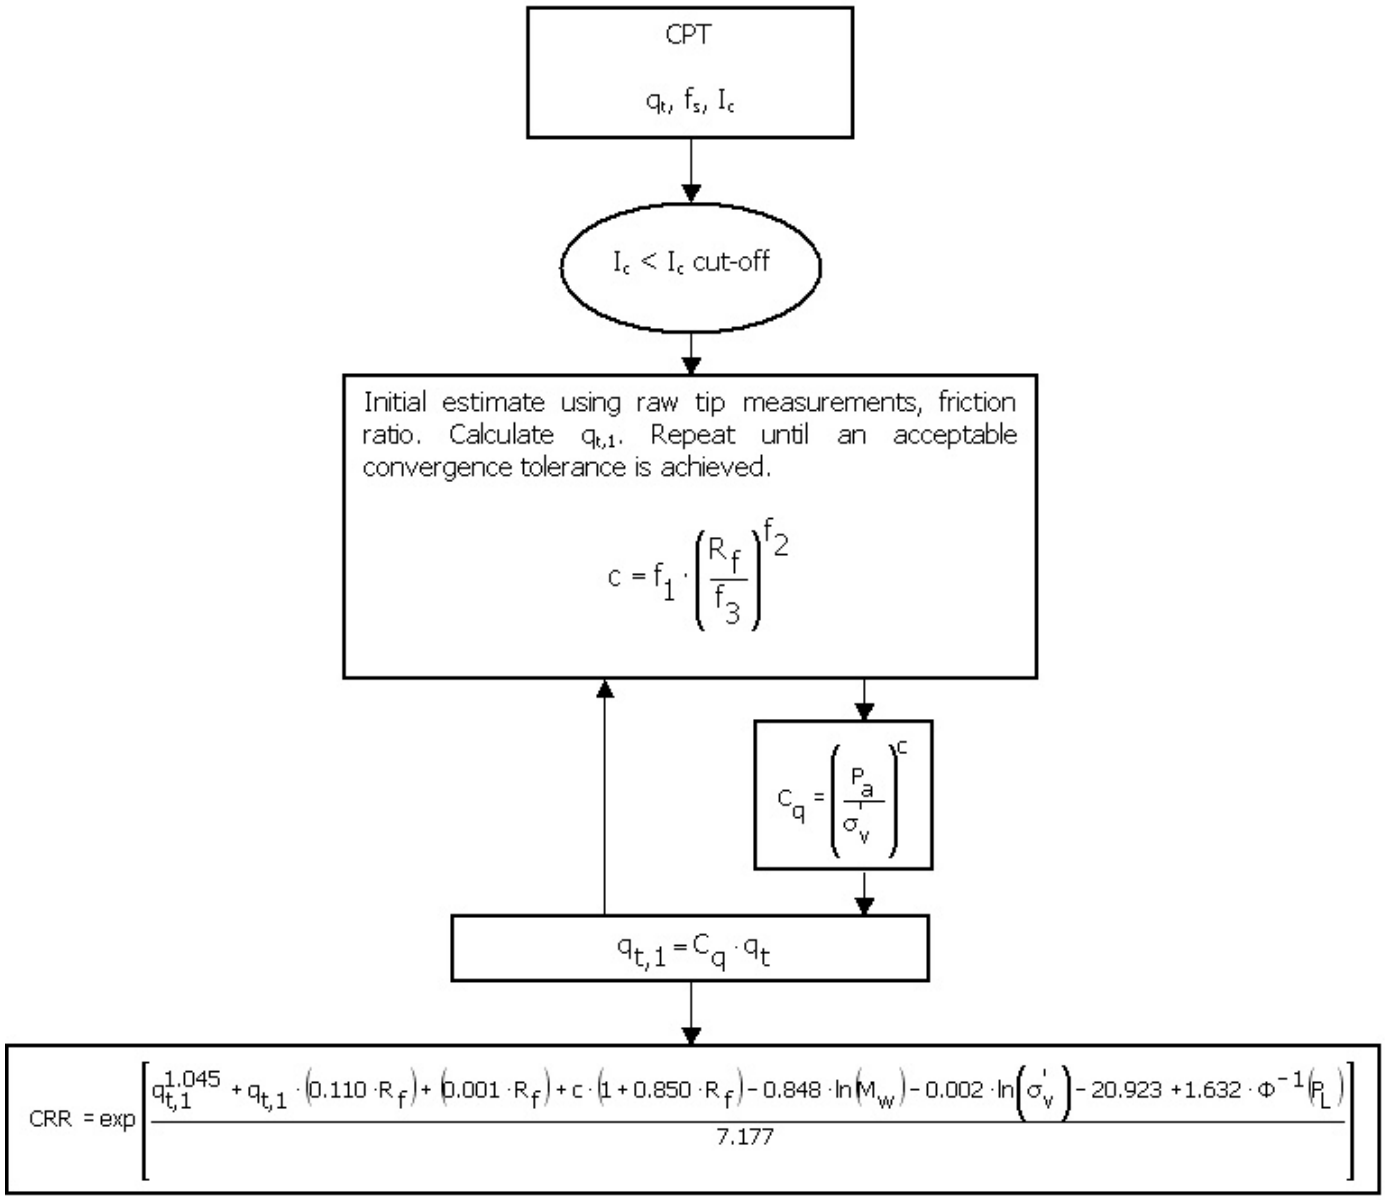
Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. The procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

[1] "Estimating liquefaction-induced ground settlements from CPT for level ground", G. Zhang, P.K. Robertson, and R.W.I. Brachman



Procedure for the evaluation of soil liquefaction resistance (all soils), Robertson (2010)

Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. This procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:



[1] P.K. Robertson, 2009. "Performance based earthquake design using the CPT", Keynote Lecture, International Conference on Performance-based Design in Earthquake Geotechnical Engineering – from case history to practice, IS-Tokyo, June 2009

Procedure for the evaluation of soil liquefaction resistance, Idriss & Boulanger (2008)

Procedure for the evaluation of soil liquefaction resistance (sandy soils), Moss et al. (2006)

Procedure for the evaluation of soil liquefaction resistance, Boulanger & Idriss(2014)

$$FS_{liq} = \frac{CRR_{M=7.5,\sigma'_v=1atm}}{CSR_{M=7.5,\sigma'_v=1atm}}$$

$$CSR_{M=7.5,\sigma'_v=1atm} = 0.65 \frac{\sigma_v}{\sigma'_v} \frac{a_{max}}{g} r_d \frac{1}{MSF} \frac{1}{K_\sigma}$$

$$r_d = \exp\left[\alpha(z) + \beta(z) \cdot M\right]$$

$$\alpha(z) = -1.012 - 1.126 \sin\left(\frac{z}{11.73} + 5.133\right)$$

$$\beta(z) = 0.106 + 0.118 \sin\left(\frac{z}{11.28} + 5.142\right)$$

$$K_\sigma = 1 - C_\sigma \ln\left(\frac{\sigma'_v}{P_a}\right) \le 1.1$$

$$C_\sigma = \frac{1}{37.3 - 8.27\left(q_{c1Ncs}\right)^{0.264}} \le 0.3$$

$$MSF = 1 + \left(MSF_{max} - 1\right)\left(8.64 \exp\left(\frac{-M}{4}\right) - 1.325\right)$$

$$MSF_{max} = 1.09 + \left(\frac{q_{c1Ncs}}{180}\right)^3 \le 2.2$$

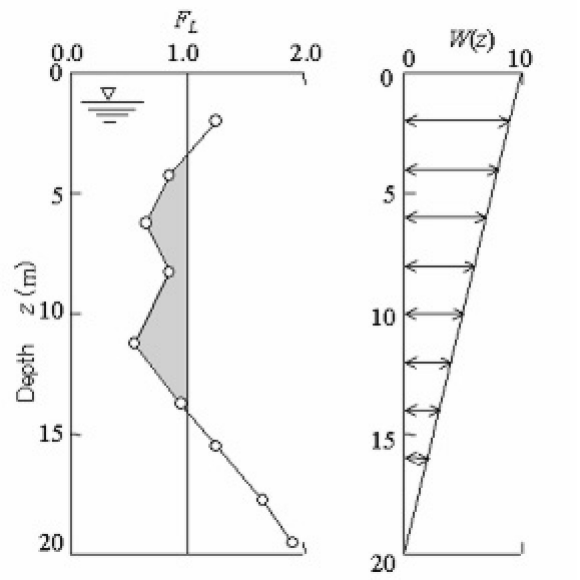
Procedure for the estimation of seismic induced settlements in dry sands

Robertson, P.K. and Lisheng, S., 2010, "Estimation of seismic compression in dry soils using the CPT" FIFTH INTERNATIONAL CONFERENCE ON RECENT ADVANCES IN GEOTECHNICAL EARTHQUAKE ENGINEERING AND SOIL DYNAMICS, Symposium in honor of professor I. M. Idriss, San Diego, CA

Liquefaction Potential Index (LPI) calculation procedure



Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.

To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\text{LPI} = \int_0^{20} (10 - 0{,}5z) \times F_L \times dz$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

Graphical presentation of the LPI calculation procedure

Subject: **Engineering Geology and Seismology Review for**
Central Administrative Center at Cole Campus – New Buildings
1011 Union Street, Oakland, CA
CGS Application No. 01-CGS4511

Dear Mr. Nakadegawa:

In accordance with your request and transmittal of documents received on July 17, 2020, the California Geological Survey (CGS) has reviewed the engineering geology and seismology aspects of the consulting report prepared for the subject project at the Central Administrative Center at Cole Campus in Oakland. It is our understanding that this project involves construction of a new two-story office building and a single-story multi-purpose building. This review was performed in accordance with Title 24, California Code of Regulations, 2019 California Building Code (CBC) and followed CGS Note 48 guidelines. We reviewed the following report:

> **Geotechnical Engineering and Geologic Hazards Study, Cole Campus – Central Administrative Center, Oakland, California:** Consolidated Engineering Laboratories, 2001 Crow Canyon Road, Suite 200, San Ramon, California 94583; company Project No. 84-04726-PWA, report dated May 22, 2020, 42 pages, 7 plates, 4 appendices.

Based on our review, the consultants provide a reasonable assessment of most of the engineering geology and seismology issues with respect to the proposed improvements. The principal concerns identified by the consultants are the potential for strong ground shaking. Their evaluation indicates surface fault rupture and deep-seated slope instability are not design concerns for the project.

However, CGS notes that the consultants have not included the possibility of rupture of all the segments of the Hayward fault together as is considered in the UCERF 3 community fault model, for their deterministic MCE_R spectrum used as input in the site-specific ground motion hazard analysis. The consultants are requested to **revise their site-specific ground motion analysis based on this recommendation and provide updated site-specific ground motion parameters, design response spectrum, and PGA_M.** The consultants are also requested to update their liquefaction analyses with the updated PGA_M, as needed.

In conclusion, ***the engineering geology and seismology issues at this site are not adequately assessed in the referenced reports***. It is recommended that additional information be provided as requested in the attached Note 48 Checklist Review Comments portion of this letter. The consultants are reminded that one copy of all supplemental documents should be submitted, should include the CGS application number, and should be uploaded directly to CGS at this link: https://www.conservation.ca.gov/cgs/upload-school. If you have any further questions about this review letter, please contact the primary reviewer at ((Jacqueline.bott@conservation.ca.gov).

Note 48 Checklist Review Comments

In the numbered paragraphs below, this review is keyed to the paragraph numbers of California Geological Survey Note 48 (November, 2019 edition), *Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings.*

Project Location

1. Site Location Map, Street Address, County Name: Adequately addressed.
2. Plot Plan with Exploration Data with Building Footprint: Adequately addressed.
3. Site Coordinates: Adequately addressed. Latitude and Longitude provided in report: 37.8082°N, 122.2897°W

Engineering Geology/Site Characterization

4. Regional Geology and Regional Fault Maps: Adequately addressed.
5. Geologic Map of Site: Not addressed by the consultants, therefore not reviewed.
6. Geologic Hazard Zones: Adequately addressed. The consultants report the site is located within a Seismic Hazard Zone for liquefaction as identified by the State of California. The consultants report the site is not currently within a designated Earthquake Fault Zone as defined by the State.
7. Subsurface Geology: Adequately addressed. The consultants report the site is underlain by Pleistocene-epoch Merritt sand, consisting of beach or near-shore deposits. They report encountering dark brown sand to silty sand layers (Merritt sand) with frequent lenses of medium dense to very dense clayey to silty sand to a depth of 27 feet, which is underlain by fine clean sand to the maximum depth explored of 50 feet. In boring B-1 the consultants report they encountered loose undocumented fill comprised of sand with brick and concrete fragments. They also report free ground water was encountered between 13 to 19 feet in their various subsurface investigations.
8. Geologic Cross Sections: Adequately addressed.
9. Geotechnical Testing of Representative Samples: Adequately addressed.
10. Consideration of Geology in Geotechnical Engineering Recommendations: Adequately addressed.
11. Conditional Geotechnical Topics: Not applicable.

Seismology & Calculation of Earthquake Ground Motion

12. Evaluation of Historic Seismicity: Adequately addressed.
13. Classify the Geologic Subgrade (Site Class): Adequately addressed. The consultants classify the site soil profile as Site Class D, Stiff Soil, based on the measured average shear-wave velocity in CPT soundings of 300 m/sec. This classification appears reasonable based on the data presented.
14. General Procedure Ground Motion Analysis: Adequately addressed. The consultants report the following parameters derived from a map-based analysis:
    S_S = 1.592 and S_1 = 0.60
    S_{DS} = 1.061
15. Site-Specific Ground Motion Hazard Analysis: **Additional information is requested**. The consultants' probabilistic MCE spectrum appears reasonable based on comparison with

results from the National Seismic Hazard Model (from Petersen and others, 2014) but their deterministic MCE spectrum appears low. CGS notes that the consultants used a M 7.2 on the Hayward (North) fault to calculate their deterministic spectrum, **but they should consider the potential for the whole Hayward fault to rupture for this analysis**, as is considered in both UCERF2 and UCERF 3 community fault models. The consultants are requested to revise their site-specific ground motion analysis using the appropriate magnitude for their deterministic spectrum. The consultants should also check whether PGA_M used in their liquefaction analysis is also appropriate and according to ASCE 7-16 Section 21.5.3.

16. Deaggregated Seismic Source Parameters: Adequately addressed.
17. Time Histories of Earthquake Ground Motion: Not applicable.

Fault Rupture Hazard Evaluation

18. Active Faulting & Coseismic Deformation Across Site: Adequately addressed. The consultants report no faults are known to be present within or project towards the site. The consultants conclude the potential for fault ground rupture and surface manifestations from fault creep are very low to nil.

Liquefaction/Seismic Settlement Analysis

19. Geologic Setting for Occurrence of Liquefaction: Adequately addressed. The consultants report they analyzed their boring and CPT data for the potential for liquefaction settlement as they believe the soils below the water table include layers that may be susceptible to liquefaction in response to strong ground shaking. The consultants' approach appears reasonable.
20. Seismic Settlement Calculations: **Additional information is requested**. The consultants are requested to revise their seismic settlement calculations based on their response to Item 15, using a revised PGA_M, as needed.
21. Other Liquefaction Effects: Adequately addressed. The consultants report there are no significant free faces present at the site and there are no significant continuous liquefiable subsurface layers underlying the site based on their subsurface investigation. They conclude the potential for lateral spreading is low. This conclusion appears reasonable based on the data presented.
22. Mitigation Options for Liquefaction/Seismic Settlement: Not applicable.

Slope Stability Analysis

23. Geologic Setting for Occurrence of Landslides: Adequately addressed. The consultants consider the site is not susceptible to landsliding. This conclusion appears reasonable based on the data presented.
24. Determination of Static and Dynamic Strength Parameters: Not applicable.
25. Determination of Pseudo-Static Coefficient (K_{eq}): Not applicable.
26. Identify Critical Slip Surfaces for Static and Dynamic Analyses: Not applicable.
27. Dynamic Site Conditions: Not applicable.
28. Mitigation Options for Landsliding/Other Slope Failure: Not applicable.

Other Geologic Hazards or Adverse Site Conditions

29. Expansive Soils: Adequately addressed. The consultants report the near-surface soils are generally of very low expansion potential.
30. Corrosive/Reactive Geochemistry of the Geologic Subgrade: Adequately addressed. The consultants report the site soils should have a negligible impact on buried concrete structures and non-corrosive rating to cast and ductile iron pipes based on corrosion testing
31. Conditional Geologic Assessment: Adequately addressed. No significant conditional hazards of potential concern were identified by the consultants.

Report Documentation

32. Geology, Seismology, and Geotechnical References: Adequately addressed.
33. Certified Engineering Geologist: Adequately addressed.
    Joel E. Baldwin II, Certified Engineering Geologist #1132
34. Registered Geotechnical Engineer: Adequately addressed.
    Corey T. Dare, Registered Geotechnical Engineer #2013

Subject: **Second Engineering Geology and Seismology Review for Central Administrative Center at Cole Campus – New Buildings 1011 Union Street, Oakland, CA CGS Application No. 01-CGS4511**

Dear Mr. Nakadegawa:

In accordance with your request and transmittal of additional documents received on July 17 and September 28, 2020, the California Geological Survey (CGS) has reviewed the engineering geology and seismology aspects of the consulting reports prepared for the subject project at the Central Administrative Center at Cole Campus in Oakland. It is our understanding that this project involves construction of a new two-story office building and a single-story multi-purpose building. This review was performed in accordance with Title 24, California Code of Regulations, 2019 California Building Code (CBC) and followed CGS Note 48 guidelines. We reviewed the following report for this additional review of the project:

> **Response to CGS Review Comments, Cole Campus – Central Administrative Center, 1011 Union Street, Oakland, California 94607:** Consolidated Engineering Laboratories, 2001 Crow Canyon Road, Suite 200, San Ramon, California 94583; company Project No. 84-04726-B, letter report dated September 25, 2020, 2 pages, 2 attachments (includes a revised Geotechnical Report dated September 25, 2020).

In addition, we previously reviewed the following report:

> **Geotechnical Engineering and Geologic Hazards Study, Cole Campus – Central Administrative Center, Oakland, California:** Consolidated Engineering Laboratories, 2001 Crow Canyon Road, Suite 200, San Ramon, California 94583; company Project No. 84-04726-PWA, report dated May 22, 2020, 42 pages, 7 plates, 4 appendices.

CGS previously submitted our findings regarding this project in a review letter dated September 10, 2020, in which CGS requested the consultants revise their site-specific ground motion analysis. This was based on the recommendation that the consultants include the possibility of rupture of all segments of the Hayward fault together, as is considered in the UCERF 3 community fault model, for their deterministic MCE_R spectrum. In addition, the consultants were requested to update their liquefaction analyses with the updated PGA_M resulting from the revised ground motion analysis, as needed.

Discussion of Site-Specific Ground Motion Analysis

Based on this second review, the consultants revised their site-specific ground motion analyses and include the possibly of a rupture of all segments of the Hayward fault together in their deterministic analyses. The consultants' updated deterministic and probabilistic MCE spectra both appear reasonable based on comparison with results from the National Seismic Hazard Model (from Petersen and others, 2014). The consultants report their site-specific seismic design parameters are: $\mathbf{S_{DS} = 1.185}\boldsymbol{g}$ and $\mathbf{S_{D1} = 1.100}\boldsymbol{g}$. Alternatively, S_a values presented in the last column of Table 5 (on page 25 of the revised Geotechnical Report dated September 25, 2020) may be used with the equivalent lateral force procedure, per ASCE 7, Section 21.4. The site-specific ground motion analysis presented in their revised Geotechnical Report dated September 25, 2020 appears to be reasonable and in accordance with ASCE 7-16.

Discussion of Liquefaction Analyses

Based on this second review, the consultants revised their liquefaction analyses based on an updated $\mathbf{PGA_M}$ **of 0.7***g* resulting from their revised ground motion analysis. They report liquefaction-induced seismic vertical settlement on the order of 0.34 to 0.66 inches and up to 0.1 inches of dynamic compaction settlement, resulting in total potential vertical settlement estimates of 0.42 to 0.72 inches. They estimate differential settlement to be half to two-thirds of the maximum total vertical settlement. They note that the liquefiable layer is at a depth of 15 to 18 feet and so overlain by 5 meters of non-liquefiable materials and thus they do not expect any manifestation of this settlement to significantly impact the bearing capacity of the soils. These results and conclusions appear reasonable based on the data presented.

Based on the discussions above, the consultants have now addressed our earlier concern regarding the site-specific ground motion analysis and liquefaction analyses for this site. The consultants have provided a thorough evaluation of engineering geology and seismology issues with respect to the proposed improvements. The principal concerns identified by the consultants are the potential for strong ground shaking, potential liquefaction-induced total vertical settlement of less than 1.0 inch, and the presence of loose undocumented fill in some areas at the site. The consultants recommend design spectral acceleration parameters of $\mathbf{S_{DS} = 1.185}\boldsymbol{g}$ and $\mathbf{S_{D1} = 1.100}\boldsymbol{g}$, which are considered reasonable. Their evaluation indicates surface fault rupture and deep-seated slope instability are not design concerns for the project.

In conclusion, ***the engineering geology and seismology issues at this site are adequately assessed in the referenced reports, and no further information is requested***. If you have any further questions about this review letter, please contact the primary reviewer at Jacqueline.Bott@conservation.ca.gov.

EXECUTIVE SUMMARY

Ninyo & Moore was retained by Oakland Unified School District (OUSD) to perform a Phase I Environmental Site Assessment (ESA) on the OUSD Central Administrative Center property located at 1011 Union Street in Oakland, California (site). The site is also identified as Alameda County Assessor's Parcel Number(s) 004 005300700.

The objective of this ESA is to identify, to the extent feasible pursuant to the process described in ASTM E1527-13, recognized environmental conditions (RECs), which are defined by ASTM as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The results of this ESA are summarized below:

- Historical research revealed that the site was developed in the late 1870s with an the Cole Grammar School on the southern portion of the site and several residential houses on the northern portion of the site. During the 1920s the original school building was burned down and the residential houses were demolished and they were replaced with a two-story elementary school building, a cafeteria building, five temporary classrooms, and a parking lot. In the 1950s several temporary classrooms were added and removed. In the late 1960s a Kindergarten building was constructed on the eastern portion of the site. In the early 1970s the Kindergarten building was removed and replaced with five portable buildings, which were later removed in the late 1970s. In the early 2010s the eastern portion of the parking lot on the site was fenced-off and used as the restricted parking of the Oakland School Police Department (OSPD), and a storage building was constructed in the northeastern corner of the site.
- On November 19th, 2019, Peter Sims of Ninyo & Moore conducted a site reconnaissance of the property. The reconnaissance involved a visual inspection of the site, and observations of adjoining properties. At the time of the reconnaissance, the approximate 2.59-acre site was developed with a two-story school building, a cafeteria building, a storage building, and a parking lot. According to Colland Jang, the site representative, the school building was used as an elementary school (Cole Elementary) until approximately 10 years ago. The OUSD special education program occupies the first floor of the school building and approximately 1/3 of the second floor as well as the former cafeteria building, while the OSPD occupies approximately 2/3 of the second floor.
- Interior construction materials included carpeting, ceramic floor tiles, painted and textured plaster walls, and plaster ceilings. Interior finishes appeared to be in good condition.
- The exterior of the buildings consisted of an asphalt parking area on the north side of the building.

- The areas surrounding the site consist primarily of residential buildings to the east south, and west, and an industrial building and a park to the north.
- Based on our site visit, there are currently no wells on the site.
- Ninyo & Moore did observe quantities of hazardous substances or petroleum products used or stored on site during our site reconnaissance. Diesel fuel that supplies the back up generator is stored within the back up generator.
- In August 1998 a 2,000-gallon heating oil tank, reportedly used to fuel the on-site boilers, was removed from the southern portion of the site by ACC Environmental Consultants (ACC). Soil samples were analyzed and only low to no concentrations of contaminants were detected in the soil. ACC recommended no further investigation. This is considered a HREC to the site.
- Indications of underground storage tanks (USTs), or hazardous material spills or leaks, were not observed during the site reconnaissance. The diesel fuel for the back up generator is stored in an aboveground storage tank (AST) inside the generator.
- In 1993 two 10,000-gallon petroleum fuel oil USTs and one 750-gallon diesel UST were removed from the California Cereal Products/Nabisco Brands Inc property located at 1267 14th Street, to the adjacent to the north of the site.
- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides (OCPs), may be found in the soil surrounding the buildings. This is considered a REC.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. This is considered a REC.
- Naturally occurring asbestos (NOA) can be found in some rocks, sediments, and soils throughout the world. According to the geotechnical report completed for the site included in Appendix D, there is no mapped sources of NOA in the site or site vicinity, therefore it is not considered a REC.
- In 1994, at the California Cereal Products/Nabisco Brands Inc property, five 55-gallon, two 30-gallon, and two 5-gallon containers of unknown substances were dumped and burned on the railroad tracks. The property is located downgradient of the site, to the north, at 1267 14th Street. The spill occurred approximately 300 feet north of the site. This was labeled as illegal dumping and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean up was completed, and that the dumping took place downgradient from the site, this is not considered a REC to the site.
- Review of an environmental database report obtained for this project indicated that the site is listed on several of the regulatory databases researched by Environmental Data Resources Inc. (EDR), including the CERS, EMI, HAZNET, and FINDS databases. The site is listed on the EMI database for emitting small amounts of organic hydrocarbon

gases, carbon monoxide, oxides of Nitrogen and Sulfur, and particulate matter, from 2013 to 2017. The site is listed on the HAZNET database for disposing of several tons of asbestos containing waste from 1992 to 2015. The site is also listed on the HAZNET database for disposing of 1.168 tons of polychlorinated biphenyls (PCBs) in 1994.

- Several off-site facilities were located within the EDR search radius from the site. None of the listed facilities are considered to be a REC to the site at this time based on several factors, including distance from the site, location relative to the regional groundwater flow direction (e.g. hydraulically downgradient or crossgradient to the site), database listing type, and affected media (soil only). Refer to Section 5.1.2 for additional information regarding potential off site facilities of concern.
- Based on the completion of the Vapor Encroachment Condition (VEC) screening matrix, it is presumed unlikely that a VEC currently exists beneath the site.

CONCLUSIONS

Ninyo & Moore has performed this ESA in conformance with the scope and limitations of ASTM E1527-13 of the OUSD Central Administrative Center property located at 1011 Union Street in Oakland, California. Based on the information compiled during the preparation of this report, this assessment has revealed no evidence of RECs in connection with the site at this time.

- The UST removed from the site by ACC Environmental Consultants in August 1998 represents a HREC to the site.
- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides (OCPs), may be found in the soil surrounding the buildings. This is considered a REC to the site.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. This is considered a REC to the site.

RECOMMENDATIONS

Based on the findings of this ESA, further investigation is recommended at this time.

- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides, may be found in the soil surrounding the buildings. Soil samples should be collected around the perimeter of the buildings and analyzed for lead, arsenic, and OCPs.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. Soil samples should be collected immediately adjacent to the incinerator and analyzed for metals and SVOCs.

1. INTRODUCTION

Ninyo & Moore has performed this ESA in conformance with the scope and limitations of ASTM E1527-13 of the OUSD Central Administrative Center property located at 1011 Union Street in Oakland, California (site). This ESA was conducted for Oakland Unified School District. The following sections identify the purpose, the involved parties, the scope of services, and the limitations and exceptions associated with this ESA.

1.1. Purpose

In accordance with ASTM E1527-13, the objective of the ESA is to identify recognized environmental conditions. The term recognized environmental conditions (RECs) means "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include *de minimis* conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions."

Identification of RECs will fall into three categories: existing REC (as defined above), Historical REC (HREC), or Controlled REC (CREC).

- HREC - An HREC is defined as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations (AULs), institutional controls, or engineering controls)."
- CREC - A CREC is defined as "a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, AULs, institutional controls, or engineering controls)."

1.2. Involved Parties

Peter Sims, a Project Geologist with Ninyo & Moore, was the Environmental Professional assigned to this project. Kristopher Larson, Principal Geologist with Ninyo & Moore, performed project oversight and quality review. Resumes of these individuals are included in Appendix A.

1.3. Scope of Services

Ninyo & Moore's scope of services for this ESA included the following:

- Performance of a site reconnaissance to visually and/or physically observe the interior and exterior of structures and other features on the site as well as visible exterior features of adjoining properties to identify areas of possibly contaminated surface soil or surface water, improperly stored hazardous materials, and possible risks of contamination from activities at the site and adjoining properties. Photographs of relevant site features are provided in Appendix B.
- Review of reasonably ascertainable standard environmental record sources including federal, state, and tribal regulatory agency databases for the site and for properties located within a specified radius of the site (Appendix C). The purpose of this review was to evaluate possible environmental impacts to the site and site vicinity activities. These databases list locations of known hazardous waste sites, leaking underground storage tanks (LUSTs), permitted facilities that utilize USTs, and facilities that use, store, or dispose of hazardous materials, hazardous wastes, and/or petroleum products.
- Review of reasonably ascertainable additional environmental record sources including local records and/or additional state or tribal records for the site and for properties located within a specified radius of the site. The purpose of this review was to evaluate possible environmental impacts to the site and site vicinity activities. These databases list locations of known hazardous waste sites, solid waste landfills, registered storage tanks, emergency releases, contaminated public wells, and facilities that use, store, or dispose of hazardous materials and/or petroleum products.
- Provide supporting documentation, when available (Appendix D).
- Review of reasonably ascertainable standard physical setting sources including a current United States Geological Survey (USGS) 7.5-minute topographic map, and possibly including USGS and/or state groundwater and geologic maps, and soil maps. The purpose of this review was to note information about the geologic, hydrologic, and/or topographic characteristics of the site and site vicinity.
- Review of reasonably ascertainable historical documents may include aerial photographs, historical fire insurance maps, and/or city directories. The purpose of this review was to review obvious uses of the site from the present, back to the site's first developed use, or back to 1940, whichever is earlier (Appendix E).
- Performance of interviews with present owners, operators, and occupants of the site as well as other knowledgeable parties as appropriate/available. The purpose of these interviews is to obtain information regarding potential RECs in connection with the site.
- Perform a preliminary vapor encroachment screening assessment on the site and adjoining properties (Appendix F).

- Preparation of this ESA report documenting methodology, reporting findings, significant data gaps, and conclusions, and providing opinions of the impact on the site of conditions noted in the findings section regarding RECs at the site.

1.4. Limitations and Exceptions

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard of care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

The findings, opinions, and conclusions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control. Ninyo & Moore cannot warrant or guarantee that not finding indicators of any particular hazardous material means that this particular hazardous material or any other hazardous materials do not exist on the site. Additional research, including invasive testing, can reduce the uncertainty, but no techniques now commonly employed can eliminate the uncertainty altogether.

1.5. Special Terms and Conditions

Ninyo & Moore was not made aware of any special terms and conditions associated with the site.

1.6. User Reliance

This report may be relied upon by, and is intended exclusively for, Oakland Unified School District. Any use or reuse of the findings, opinions, and/or conclusions of this report by parties other than the client is undertaken at said parties' sole risk.

1.7. Physical Limitations

Physical limitations were not encountered during the site reconnaissance.

1.8. Data Gaps

A data gap is a "lack of or inability to obtain data required by this practice despite good faith efforts to gather such data." In completing this ESA, Ninyo & Moore encountered no significant data gaps that affect the ability of the EP to identify RECs on the site.

2. SUBJECT SITE

The following sections provide a general description of the site and adjacent properties. Photographs taken during the site reconnaissance are provided in Appendix B.

2.1. Site Description

At the time of the site reconnaissance, the site was developed with a two-story former elementary school building, a former cafeteria building, a storage building, a playground, and two parking lots. The site was occupied by the OUSD special education program, and the OUSD Police Department. The site is located at 1011 Union Street in Oakland, California. The site is situated on one parcel totaling approximately 2.59 acres of land designated by Alameda County Assessor's Parcel Number 004 005300700. The site location is presented on Figure 1 and the site vicinity with additional information concerning the site and surrounding properties is presented on Figure 2.

2.2. Site Reconnaissance

On November 19th, 2019, Peter Sims, Project Geologist with Ninyo & Moore, conducted a site reconnaissance of the property. The reconnaissance involved a visual inspection of the site, and observations of adjoining properties. Colland Jang escorted Peter Sims around the property during the site reconnaissance.

2.2.1. Site Improvements

At the time of the site reconnaissance, the site was occupied by municipal development. Site development included one two-story school building, one former cafeteria building, one storage building, a playground, and two parking lots. The following summarizes key on-site observations for indications of the following potential environmental concerns:

On-Site Observations			
Conditions	**Observed Yes**	**Observed No**	**Comments**
Hazardous Substances/Petroleum Products	X		Diesel petroleum products are found in the AST associated with the diesel back-up generator located on the north side of the school building.
Waste Generation/Storage/Disposal		X	
Unidentified Substance Containers		X	
Storage Tanks (ASTs and/or USTs)	X		A diesel AST is associated with the diesel back-up generator located on the north side of the school building.
Potential PCB-Containing Equipment		X	
Chemical/Petroleum Odors		X	
Concrete Patches/Pads		X	
Pools of Liquid		X	
Sewage Discharge Pipes		X	

Conditions	Observed Yes	Observed No	Comments
Floor Drains/Sumps	X		Floor drains and a sump were located in the basement of the school building.
Elevator	X		An elevator is located on the exterior of the school building. The elevator maintenance room showed no signs of hydraulic leakage or staining.
Wells		X	
Drums		X	
Indications of Staining		X	
Stressed Vegetation		X	
Pits, Ponds, or Lagoons		X	
Waste Water Discharges/Disposal Systems		X	
Storm Water Systems	X		Storm drains were located in the parking lots.
Septic Systems/Cesspools		X	
Municipal Solid Waste Disposal Areas	X		A waste disposal area was located on the northwest corner of the former cafateria building.
Other Environmental Concerns or Conditions	X		Two boilers and an unused incinerator were located in the basement. According to the site contact Mr. Jang, the boilers are fueled by natural gas. The incinerator was used to dispose of waste generated by the school. A back-up generator was located on the northern exterior of the school building. According to the site contact Mr. Jang, the generator is fueled by diesel but does not have an associated underground storage tank (UST).

2.2.2. Roads

As shown on Figure 2, the site is accessible from Union Street to the east, 10th Street to the South, and Poplar Street to the west.

2.2.3. Site Occupants

The site is owned by the Oakland Unified School District (OUSD), and is occupied by the OUSD special education program on the first and part of the second floor, and by the OUSD Police Department, which occupies the remainder of the second floor.

2.2.4. Source of Potable Water

The East Bay Municipal Utilities District (EBMUD) provides potable water to the site and site vicinity.

2.2.5. Sewage Disposal System

EBMUD provides municipal sewer service to the site and surrounding areas.

2.2.6. Source of Fuel for Heating and Cooling

The fuel source for the on-site heating and cooling systems was provided by PG&E.

2.3. Adjoining Properties

The following table lists the properties adjoining the site and associated land use. Based on the nature of the adjoining properties, information available in agency databases, and observations made during our site reconnaissance, off-site properties may have impacted the environmental integrity of the site at this time.

- In 1994, at the California Cereal Products/Nabisco Brands Inc property, five 55-gallon, two 30-gallon, and two 5-gallon containers of unknown substances were dumped and burned on the railroad tracks. The property is located downgradient of the site, to the north, at 1267 14th Street. The spill occurred approximately 300 feet north of the site.This was labeled as illegal dumping and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean up was completed, and that the dumping took place downgradient from the site, this is not considered a REC to the site.

Adjoining Properties	
Location	**Description**
North	California Cereal Products/Nabisco Brands Inc (RCRA NONGEN/NLR, Envirostor, LUST, ALAMEDA COUNTY CS, HIST CORTESE, CERS, CERS HAZ WASTE, HAZNET, HIST UST, NOTIFY 65), and a playground.
South	Oakland Housing Authority (LUST, SWEEPS UST, HIST UST, CA FID UST, HIST CORTESE, CERS), and several row houses.
East	Several residential houses
West	Several row houses

3. USER PROVIDED INFORMATION

The following sections summarize information provided by the user to assist the environmental professional in identifying the possibility of RECs in connection with the site and to fulfill the user's responsibilities in accordance with Section 6 of ASTM E1527-13. The User Questionnaire was completed by Tadashi Nakadegawa. A copy of the User Questionnaire is included in Appendix D.

3.1. Title Records

A Preliminary Title Report was not provided to Ninyo & Moore.

3.2. Environmental Liens or AULs

Ninyo & Moore was not informed of the existence of environmental liens or AULs associated with the site.

3.3. Specialized Knowledge

Colland Jang provided no specialized knowledge regarding the site.

3.4. Commonly Known or Reasonably Ascertainable Information

_Ninyo & Moore was not informed of the existence of commonly known or reasonably ascertainable information pertaining to the site that is material to the identification of RECs in connection with the site.

3.5. Valuation Reduction for Environmental Issues

Information pertaining to valuation reduction was not communicated to Ninyo & Moore for the purpose of this assessment.

3.6. Owner, Property Manager, and Occupant Information

The site is currently owned by the Oakland Unified School District (OUSD).

3.7. Reason for Performing Phase I

This ESA has been completed for the exclusive use of Oakland Unified School District as part of their due diligence of the property.

4. PHYSICAL SETTING

The following sections include discussions of topographic, geologic, and hydrologic conditions.

4.1. Topographic Conditions

Based on a review of the United States Geological Survey (USGS) 7.5-Minute Topographic Quadrangle Map Series of the Oakland West 2012 Quadrangle, the site is situated at an elevation of approximately 20 feet above mean sea level. The topography of the site generally slopes towards the northwest.

4.2. Geology and Soil Conditions

The site is located in the Coast Range geomorphic province of California. The Coast Ranges are northwest-trending mountain ranges (2,000 to 4,000, occasionally 6,000 feet elevation above sea level), and valleys. The ranges and valleys trend northwest, subparallel to the San Andreas Fault. Strata dip beneath alluvium of the Great Valley. To the west is the Pacific Ocean. The coastline is uplifted, terraced and wave-cut. The Coast Ranges are composed of thick Mesozoic and Cenozoic sedimentary strata. The northern and southern ranges are separated by a depression containing the San Francisco Bay. The northern Coast Ranges are dominated by irregular, knobby, landslide-topography of the Franciscan Complex. The eastern border is characterized by strike-ridges and valleys in Upper Mesozoic strata. In several areas, Franciscan rocks are overlain by volcanic cones and flows of the Quien Sabe, Sonoma and Clear Lake volcanic fields. The Coast Ranges are subparallel to the active San Andreas Fault. The San Andreas is more than 600 miles long, extending from Pt. Arena to the Gulf of California. West of the San Andreas is the Salinian Block, a granitic core extending from the southern extremity of the Coast Ranges to the north of the Farallon Islands (CGS, 2002).

According to the geotechnical report included in Appendix D, the site is located in the flatlands west of the base of the Oakland Hills, which is proximal to the San Francisco Bay structural depression to the west. Bedrock underlying the Oakland-San Leandro area and exposed in the hills to the east primarily consists of gabbro and basalt of the Jurassic Coast Range Ophiolite, Late Jurassic-Early Cretaceous Franciscan rocks, Jurassic silicic volcanics and Late Jurassic-Early Cretaceous Knoxville Formation .

The 1977 California Division of Mines and Geology, *Geologic Map of California*: (Jennings C.W.) shows the site to be underlain by Quaternary Marine and Non-marine Sand Deposits (Qs).

Based on our review of the EDR Radius Map report, the primary soil type beneath the site is mapped as Urban Land (EDR, 2019).

According to the geotechnical report, the site is located in a seismically active region dominated by major faults of the San Andreas Fault System. Major active faults include the aforementioned San Andreas Fault; the Hayward Fault, located approximately 4 miles northeast of the site; the Calaveras Fault, located around 14 miles northeast of the site; the Concord-Green Valley Fault, located around 18 miles northeast of the site and the San Gregorio Fault, estimated to be around 23 miles southwest of the site.

4.3. Site Hydrology

The following sections discuss the site hydrology in terms of surface water and groundwater.

4.3.1. Surface Waters

Surface waters, including ponds, streams, creeks, lagoons and other naturally-occurring bodies of water, were not observed on the site at the time of our reconnaissance.

4.3.2. Groundwater

Groundwater information for the site was not available. Ninyo & Moore reviewed the State Water Resources Control Board's GeoTracker website (GeoTracker) for groundwater information in the site vicinity. According to GeoTracker, groundwater information reported in a Second Half 2018 groundwater monitoring report for the former Shell-branded service station located at 1230 14th Street (approximately 750 feet northeast of the site), the groundwater flow direction in the site vicinity was reported to be towards the northeast and the depth to groundwater was reported to be approximately 11 to 13 feet below ground surface (ft bgs). Groundwater depths and flow directions can vary due to seasonal variations, groundwater withdrawal or injection, tidal influences, and other factors.

According to the geotechnical report included in Appendix D, free groundwater was encountered at a depth of 18 to 19 ft bgs borings advanced for the geotechnical investigation in November, 2019.

5. RECORDS REVIEW

The following sections summarize records reviewed for the site.

5.1. Environmental Record Sources

Environmental Data Resources, Inc. (EDR) performed a computerized environmental information database search for the site and site vicinity. The EDR report included federal, state, and local databases. The review was conducted to evaluate whether or not the site or properties within the vicinity of the site have been listed as having experienced significant unauthorized releases of hazardous substances or other events with potentially adverse environmental effects for the site. A summary of the environmental databases searched, their corresponding search distance, and the number of listed off-site properties of potential environmental concern to the site are presented in the following table. A copy of the EDR Radius Map Report is presented in Appendix C.

Map Findings Summary								
Database	**Target Property**	**Search Distance (Miles)**	**< 1/8**	**1/8 - 1/4**	**1/4 - 1/2**	**1/2 - 1**	**> 1**	**Total Plotted**

5.1.1. Regulatory Database Listings for the Site

The following table summarizes the database listings related to the site:

On-Site Database Listings	
Site Name	OAKLAND UNIFIED SCHOOL DISTRICT
Site Address	1011 UNION STREET
Database	CERS, EMI, HAZNET, FINDS
Comments	The site is listed on the EMI database for emitting: -0.003 tons of total organic hydrocarbon gases, 0.008 tons of carbon monoxide gases, 0.053 tons of oxides of nitrogen, and 0.002 tons of particulate matter, in 2013. -0.003 tons of total organic hydrocarbon gases, 0.008 tons of carbon monoxide gases, 0.053 tons of oxides of nitrogen, 0.00009 tons of oxides of sulphur, and 0.002 tons of particulate matter, in 2014. -0.003 tons of total organic hydrocarbon gases, 0.008 tons of carbon monoxide gases, 0.053 tons of oxides of nitrogen, 0.00009 tons of oxides of sulphur, and 0.002 tons of particulate matter, in 2015. -0.003 tons of total organic hydrocarbon gases, 0.008 tons of carbon monoxide gases, 0.053 tons of oxides of nitrogen, 0.00009 tons of oxides of sulphur, and 0.002 tons of particulate

Comments	matter, in 2016. -0.003 tons of total organic hydrocarbon gases, 0.008 tons of carbon monoxide gases, 0.053 tons of oxides of nitrogen, 0.00009 tons of oxides of sulphur, and 0.002 tons of particulate matter, in 2017. The site is listed on the HAZNET database for: -disposing 2.53 tons of asbestos containing waste in a landfill, in 1992. -recycling 1.168 tons of polychlorinated biphenyls (PCBs) and materials contianing PCBs in 1994. -disposing 29.49 tons of asbestos containing waste in a landfill, in 2002. -disposing 0.4 tons of asbestos containing waste in a landfill, in 2011. -disposing 0.23 tons of asbestos containing waste in a landfill, in 2015. None of these listings are considered a REC to the site.

5.1.2. Regulatory Database Listings for Off-Site Properties

Off-site properties/facilities listed in the **Map Findings Summary** table above were evaluated as to their potential to impact soil, soil vapor, and/or groundwater at the site. The following table presents the properties/facilities that were interpreted to represent a potential environmental concern to the site, based on their proximity to the site, the nature of the database on which they are listed, and/or the assumed direction of groundwater flow in the site vicinity.

It is our opinion that there is a low likelihood that the off-site properties listed in the Facilities of Potential Concern table below (or other facilities listing in the Map Findings Summary table above) represent a REC to the site. This opinion is based on one or more of the following factors:

- The nature of the database(s) on which the property is listed, and/or because the property was not listed on a database that reports unauthorized releases of hazardous substances;
- Reported regulatory agency status (i.e., case closed);
- Reported nature of the case (i.e., soil contamination only);
- Reported distance of the property from the site; and/or
- Location of the property in relation to the site with respect to topography or expected groundwater flow direction (northeast).

Facilities of Potential Concern	
Site Name	OAKLAND CITY OF HOUSING AUTHORITY
Site Address	935 UNION ST
Distance from Site	50 feet
Direction from Site	South and upgradient
Database	CERS, LUST, SWEEPS UST, HIST CORTESE, CA FID UST, HIST UST
Comments	This property is listed on the LUST database for a gasoline leak from an underground storage tank (UST). The case was opened in October 1988 and after remediation and cleanup activities were completed to the satisfaction of the regulatory agency, the case was closed in June 1993. Due to the closed nature of the case, this is not considered a REC to the site.

Site Name	NABISCO BRANDS INC
Site Address	1267 14TH ST
Distance from Site	352 feet
Direction from Site	NNE and downgradient
Database	CERS, LUST, HIST CORTESE, Alameda County CS, ENVIROSTOR
Comments	This property is listed on the LUST database for a waste oil leak from an UST contaminating non-potable groundwater. The case was opened in August 1988 and after remediation and cleanup activities were completed to the satisfaction of the regulatory agency, the case was closed in June 1993. Due to the closed nature of the case, the downgradient rtelationship to the site, and the distance from the site, this is not considered a REC to the site. This property is listed on the Envirostor database for a "site screening" in August 2006, which concluded that remediation for the closed LUST case was completed in 1992 and that no contamniants of concern (COCs) remained in the soil or groundwater at levels of concern. Due to the findings of the "site screening", this is not considered a REC to the site.

Site Name	CALIFORNIA CEREAL PRODUCTS, INC.
Site Address	1267 14TH ST
Distance from Site	352 feet
Direction from Site	NNE and downgradient
Database	CERS, HAZNET, CERS HAZ WASTE
Comments	This property is listed on the HAZNET database for: -storing 0.05 tons of unspecified oil-containing waste in 2008. -storing 0.092 tons of pff-specification, aged or surplus organics in 2009. -storing 0.15 tons of unspecified oil-containing waste in 2010. -storing 0.15 tons of unspecified oil-containing waste in 2011. -storing 0.3 tons of unspecified oil-containing waste in 2012. This property is listed on the CERS database for several violations and failures of the California Health and Safety Code in 2018. All of the violations and failures were corrected and returned to compliance. This is not considered a REC to the site. In 1994, at the California Cereal Products/Nabisco Brands Inc property, five 55-gallon, two 30-gallon, and two 5-gallon containers of unknown substances were dumped and burned on the railroad tracks. The property is located downgradient of the site, to the north, at 1267 14th Street. The spill occurred approximately 300 feet north of the site. This was labeled as illegal dumping and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean up was completed, and that the dumping took place downgradient from the site, this is not considered a REC to the site.

Site Name	PALM COURT
Site Address	902 UNION STREET
Distance from Site	495 feet
Direction from Site	South and upgradient
Database	VCP, ENVIROSTOR
Comments	This property is listed on the VCP and Environstor databases for a voluntary cleanup program that took place in 2005, in an effort to cleanup chlordane and lead in the soil. Due to the distance from the site, and the media affected (soil), this is not considered a REC to the site.

5.2. Additional Environmental Record Sources

To enhance and supplement the standard environmental record sources identified in Section 5.1, additional local and/or federal, state, or tribal records shall be checked when, in the judgement of the EP, such additional records (1) are reasonably ascertainable, (2) and sufficiently useful, accurate, and complete in light of the objective of the records review. Examples of additional record sources include department of health/environmental division, fire

department, planning/building department, or local/regional water quality agencies. Ninyo & Moore contacted the following additional record sources:

- Alameda County Environmental Health Department (ACEHD)
- The City of Oakland
- California Regional Water Quality Control Board (RWQCB)
- California Department of Toxic Substances Control (DTSC)
- State of California, Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR)

Descriptions of these agencies are provided in Sections 5.2.1 through 5.2.3 below.

5.2.1. State/County Environmental Record Sources

The RWQCB and DTSC had no records on file for the site.

The ACEHD was contacted regarding hazardous materials or hazardous wastes records associated with the site addresses. The ACEHD had records on file for the site. According to the ACEHD a 2,000-gallon heating oil UST was removed from the southern portion of the site under the supervision of ACC Environmental Consultants in August 1998. After the UST was removed, two soil samples were taken from the sidewalls of the excavation (109-T1F-11 and 109-T1-11) and four soil samples were taken from the soil stockpile (109-SP (A-D)). The samples were analyzed for total petroleum hydrocarbons as diesel (TPHd) and for benzene, toluene, ethylbenzene, and xylene (BTEX). All of the samples were below the respective detection limits except 109-T1F-11 with 1.4 milligrams per kilogram (mg/kg), and 109-SP (A-D) with 0.016 mg/kg of xylenes. No indications of staining or leakage was observed in the soil during the UST removal. Due to the lack of significant concentrations of contaminants in the soil, this is considered an HREC to the site. A copy of the UST removal report is included in Appendix D.

The ACEHD was contacted regarding hazardous materials or hazardous wastes records associated with the property adjacent to the north of the site, at 1267 14th Street (California Cereal Products/Nabisco Brands Inc). The ACEHD had records on file for the site. According to the ACEHD the property had numerous violations of the California Health and Safety Code in 2018 and 2019 including; not submitting a hazardous materials business plan (HMBP), not properly labeling empty 55-gallon drums or propane tanks, and not completing a hazardous waste manifest. The property also has records for several hazardous materials stored and used on the property in 2006. There is no indication that the violations or hazardous waste has impacted the site. This is not considered a REC.

According to the ACEHD in 1994, at the California Cereal Products/Nabisco Brands Inc property, five 55-gallon, two 30-gallon, and two 5-gallon containers of unknown substances

were dumped and burned on the railroad tracks. The property is located downgradient of the site, to the north, at 1267 14th Street. The spill occurred approximately 300 feet north of the site. This was labeled as illegal dumping and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean up was completed, and that the dumping took place downgradient from the site, this is not considered a REC to the site.

5.2.2. Local Record Sources

A Public Records Request was submitted to the City of Oakland Fire Department (OFD) regarding hazardous materials, hazardous wastes and/or underground storage tank records for the site. The OFD responded via email that they had no records on file for the site address due to the OFD transferring all files to the ACEHD in 2015. A copy of the OFD email is included in Appendix D.

5.2.3. Gas & Oil Maps

According to the DOGGR Online Mapping System, the site does not lie within the administrative boundaries of an oil field and no oil or gas wells are located on the site.

5.3. Historical Use Information

Ninyo & Moore conducted a historical record search for the site. This included a review of one or more of the following resources that were found to be both reasonably ascertainable and useful for the purposes of this ESA: historical aerial photographs, historical fire insurance maps, historical topographic maps, land use records, and interviews with property representatives. Although one or more of the sources listed above provided limited information regarding the historical use of the site, the information gathered from the sources reviewed as a whole is adequate to develop a history of the previous uses of the site and the surrounding area in accordance with Section 8.3 of ASTM E1527-13. The following sections summarize information obtained from the historical sources utilized for this assessment. The following table provides a list of historical sources reviewed for this ESA. Copies of historical research documentation, such as fire insurance maps, historical aerial photographs, and topographic maps, are provided in Appendix E.

Historical Use Information		
Data Type	**Year(s)**	**Data Limitations**
EDR Aerial Photo Decade Package (Inquiry Number 5871762.8S) Ship Date: November 15th, 2019	1939, 1946, 1958, 1963, 1968, 1974, 1982, 1993, 1998, 2005, 2009, 2012, 2016	
EDR City Directory Abstract (Inquiry Number 5871762.5S) Ship Date: November 15th, 2019	1920, 1925, 1926, 1928, 1932, 1933, 1938, 1940, 1943, 1945, 1946, 1950, 1951, 1954, 1955, 1956, 1959, 1960, 1962, 1965, 1967, 1970, 1973, 1975, 1976, 1979, 1980, 1982, 1984, 1986, 1991, 1992, 1993, 1996, 2000, 2002, 2006, 2010, 2014	

EDR Historical Topo Map (Inquiry Number 5871762.4S) Ship Date: November 15th, 2019	1895, 1899, 1915, 1948, 1949, 1959, 1968, 1973, 1980, 1996, 2012	
EDR Sanborn Map Search/Print (Inquiry Number 5871762.3S) Ship Date: November 17th, 2019	1889, 1902, 1912, 1951, 1952, 1957, 1958, 1961, 1967, 1970	
EDR Radius Map Report (Inquiry Number 5871762.2S) Ship Date: November 15th, 2019		

Historical research revealed that the site was vacant land until the late 1870s when the original Cole Grammar School was built on the site. The northern portion of the site was occupied by residential buildings. In late 1923 the school was destroyed by fire and a new Cole Elementary School building, replacing the burned down building as well as the residential buildings, was built in 1925. In the 1950s several temporary classrooms were added and removed. In the late 1960s a Kindergarten building was constructed on the eastern portion of the site. In the early 1970s the Kindergarten building was removed and replaced with five portable buildings, which were later removed in the late 1970s. In the early 2010s the eastern portion of the parking lot on the site was fenced-off and used as the restricted parking of the Oakland School Police Department (OSPD), and a storage building was constructed in the northeastern corner of the site.

5.3.1. Sanborn Fire Insurance Maps

Ninyo & Moore requested historic fire insurance rate maps (Sanborn Maps) of the site through EDR. Sanborn Fire Insurance Rate Maps for the site and surrounding areas were available for review. A summary of the Sanborn Maps reviewed is presented in the following table. A copy of the Sanborn Map Report is included in Appendix E.

Summary of Sanborn Map Listings		
Year(s)	**Site Comments**	**Adjoining Area Comments**
1889	No buildings are mapped on the site.	No buildings are mapped in the area surrounding the site.
1902	A building labeled "Cole School" is mapped on the southern portion of the site and nine residential houses are mapped on the northern portion of the site.	The area surrounding the site to the north, east, south, and west are mapped with residential houses.
1912	Three of the residential houses on the northern portion of the site are no longer mapped. Two additional houses and three apartment buildings are mapped on the northern portion of the site. A "manual training room" is mapped in the center of the site.	Two stores are mapped to the west of the site. Part of the rail way system is mapped to the north of the site.
1951	All of the residential houses and apartment buildings, along with the "manual training room" building, and the "Cole School" building, are no longer mapped on the site. A new building labeled "Cole School" as well as a cafateria building, both of which are on the site presently, as well five temporary classroom buildings are mapped on the eastern portion of the site.	The residential houses and stores to the south and west of the site are replaced with the "Peralta Villa USHA Project" consisting of several row houses as well an administative building to the south. A large industril building, with storage tanks, auto storage, and several smaller buildings, are mapped to the north of the site.
1952	No significant changes noted.	No significant changes noted.

Year(s)	Site Comments	Adjoining Area Comments
1957	Three additional temporary classrooms are mapped on the western portion of the site. One of the temporary classrooms from the eastern portion of the site is no longer mapped.	No significant changes noted.
1958	No significant changes noted.	No significant changes noted.
1961	Two additional temporary classrooms are mapped on the eastern portion of the site.	No significant changes noted.
1967	The three temporary classrooms from the western portion of the site along with four of the temporary classrooms from the eastern portion of the site, are no longer mapped. A Kindergarten building is mapped on the eastern portion of the site.	The administrative building to the south of the site is mapped as expanded.
1970	The Kindergarten building and the remaining temporary classroom are mapped as replaced five portable buildings.	No significant changes noted.

5.3.2. Historical Aerial Photographs

Ninyo & Moore reviewed historical aerial photographs of the site provided by EDR. A listing of the photographs reviewed is presented in the following table. Copies of the historical aerial photographs are provided in Appendix E.

Summary of Aerial Photographs			
Year(s)	Source	Site Comments	Adjoining Area Comments
1939	EDR	The southern portion of the site is noted to have a school building and a smaller building while the northern portion of the site is a parking lot.	The site is noted to be surrounded by residential houses to the east, south, and west, and by an industrial building to the north.
1946	EDR	A temporary classroom is noted on the eastern portion of the site.	The residential houses to the south and west of the site are noted to be removed and replaced with row houses, and an administrative building to the south.
1958	EDR	Three additional temporary classrooms are noted on the eastern portion of the site, along with three temporary classrooms on the western portion of the site.	No significant changes noted.
1963	EDR	No significant changes noted.	No significant changes noted.
1968	EDR	All of the temporary classrooms are noted to be removed. A storage building is noted on the eastern portion of the site.	No significant changes noted.
1974	EDR	The storage building on the eastern portion of the site is noted to be removed.	The residential houses to the northwest of the site are noted to be removed.
1982	EDR	No significant changes noted.	The street bordering the site to the north, 12th street, is noted to be removed. A playground and a park are noted to the north of the site.
1993	EDR	No significant changes noted.	No significant changes noted.
1998	EDR	No significant changes noted.	No significant changes noted.
2005	EDR	No significant changes noted.	The administrative building to the south of the site is noted to be removed and replaced with another building.
2009	EDR	No significant changes noted.	No significant changes noted.
2012	EDR	A playground is noted in the northern portion of the site. Two storage containers are noted on the eastern portion of the site, inside a fenced-off portion of the parking lot.	No significant changes noted.
2016	EDR	One of the storage containers on the eastern portion of the site is no longer noted.	No significant changes noted.

5.3.3. City Directories

Ninyo & Moore reviewed historical city directory listings for the site addresses to evaluate facilities of potential concern, which may have been historically located on the site. A summary of notable city directory listings is presented in the following table, and the EDR City Directory abstract is provided in Appendix E.

Summary of City Directory Listings	
Year(s)	**Notable Listings in Address Range of Site**
1920-1932	Address not listed.
1933	Cole School
1938-1940	Address not listed.
1943	Cole School
1945-1946	Address not listed.
1950	Johansen Marvin W R, Cole School
1951-1954	Address not listed.
1955	Cole School, Hiller Orville T Alameda
1956-1960	Address not listed.
1962	Cole School
1965-1967	Address not listed.
1970	Oakland Public Schools
1973-1979	Address not listed.
1980	Cole, Follow Through Program
1982-1984	Address not listed.
1986	Follow Through Program, Preschool Programs Administration
1991	Cole Elementary
1992	Oakland Public Schools
1993	Address not listed.
1996	Oakland Public Schools
2000	Project Yield
2002	Address not listed.
2006	Oakland SC Elementry
2010-2014	Oakland Unified School District

5.3.4. Historical Topographic Maps

Ninyo & Moore reviewed historical topographic maps of the site provided by EDR. A listing of the maps reviewed is presented in the following table. Copies of the historical topographic maps are provided in Appendix E.

Summary of Topographic Maps		
Year(s)	**Quadrangle**	**Site Comments**
1895	San Francisco	The site is mapped with several buildings around the perimeter of the site.
1899	San Francisco	No significant changes noted.
1915	San Francisco	No significant changes noted.
1948	San Francisco	The site is mapped with a school building in the southern portion of the site. The site mapped as urban land.
1949	Oakland West	No significant changes noted.
1959	Oakland West	The site is mapped with six additional buildings.
1968	Oakland West	No significant changes noted.
1973	Oakland West	No significant changes noted.
1980	Oakland West	Five of the additional buildings mapped on the site are no longer mapped.
1996	Oakland West	No buildings are mapped on the 1996 topographical map.
2012	Oakland West	No buildings are mapped on the 2012 topographical map.

5.3.5. Title Records

A historical chain-of-title report was not requested by the Client for review by Ninyo & Moore during the completion of this report.

5.3.6. Recorded Environmental Liens and AULs

An environmental lien search report was not requested by the Client for review by Ninyo & Moore during the completion of this report.

5.3.7. Previous Investigations

In August 1998 ACC Environmental Consultants removed a 2,000-gallon heating oil UST from the southern portion of the site. The previous investigation is described fully in Section 5.2.1.

Summary of Previous Investigations		
Report Name	**Year(s)**	**Findings**
ACC Environmental Consultants Underground Storage Tank Closure Report October 12, 1998	1998	The samples were analyzed for total petroleum hydrocarbons as diesel (TPHd) and for benzene, toluene, ethylbenzene, and xylene (BTEX). All of the samples were below the respective detection limits except 109-T1F-11 with 1.4 milligrams per kilogram (mg/kg), and 109-SP (A-D) with 0.016 mg/kg of xylenes. No indications of staining or leakage was observed in the soil during the UST removal. Due to the low concentrations of the contaminants, ACC recommended no further investigation.

5.4. Adjoining Property Use Information

Adjoining properties were described in Section 2.3. Based on the adjoining property types, none of the adjoining properties are considered to have affected the site at this time. See Section 2.3 for additional details.

6. PRELIMINARY VAPOR ENCROACHMENT SCREENING

Ninyo & Moore conducted a preliminary vapor encroachment screen (pVES) for potential chemicals of concern (COC). The pVES was based on the guidelines presented in the ASTM E2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions. The purpose of the pVES was to identify a vapor encroachment condition (VEC), which is the presence or likely presence of COC vapors in sub-surface soils at the site as a result of a release of vapors from contaminated soil or groundwater either on or near the site. The potential for VECs beneath the site was evaluated using a Vapor Encroachment Screening Matrix (VESM). The VESM included performing a Search Distance Test to identify if there are any known or suspected contaminated sites surrounding or upgradient of the site within specific search radii, a COC Test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COC are likely to be present, and a Critical Distance Test to evaluate whether or not COC in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum hydrocarbon contaminants, and 30 feet for petroleum hydrocarbon contaminants).

Based on the completion of the VESM, it is presumed unlikely that a VEC currently exists beneath the site. A copy of the VESM is included in Appendix F.

7. INTERVIEWS

Interviews were conducted by Ninyo & Moore with the objective of obtaining information regarding potential environmental concerns in connection with the site.

7.1. Owner or Key Site Manager

Colland Jang, the School Facilities Planning Consultant, was interviewed during the site reconnaissance. According to Colland Jang, the site building was constructed in the 1920s as an elementary school. Colland Jang was not aware of any hazardous materials incidents, spills, leaks or violations related to the site.

7.2. Past Owners

Past ownership entities were not made available to Ninyo & Moore during the preparation of this report. Therefore, interviews with past site owners was not conducted.

7.3. Environmental Regulatory Agency Inquiries

Ninyo & Moore submitted Public Records Requests for the site address to County, State and Local environmental regulatory agencies. The following sections describe the agencies contacted and whether or not representatives from the agencies were interviewed.

7.3.1. State/County Environmental Agencies

Ninyo & Moore requested hazardous materials records from the County Environmental Health Department ACEHD. The ACEHD had records on file for the site and a file review was conducted for the site address. The records from the ACEHD are described in Section 5.2.1.

Ninyo & Moore submitted a Public Records Request to the California Department of Toxic Substances Control (DTSC), through the EnviroStor online database, for the site address. The DTSC indicated that they had no records for the site address. Based on this information, interviews were not conducted with DTSC representatives.

Ninyo & Moore submitted a Public Records Request to the Regional Water Quality Control Board (RWQCB), through the GeoTracker online database, for the site address. The RWQCB indicated that they had no records for the site address. Based on this information, interviews were not conducted with RWQCB representatives.

7.3.2. Local Environmental Agencies

The City of Oakland Fire Department (OFD) was contacted during the preparation of this report. The OFD responded via email that they had no records on file for the site address,

due to the OFD transferring all files to the ACEHD in 2015, therefore no interviews with OFD representatives were conducted.

8. ASTM NON-SCOPE CONSIDERATIONS

Non-Scope considerations such as mold, radon, wetlands, asbestos, or flood zones were not addressed as part of this report.

9. FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

The following findings, opinions, conclusions and recommendations are provided.

9.1. Findings

- Historical research revealed that the site was developed in the late 1870s with an the Cole Grammar School on the southern portion of the site and several residential houses on the northern portion of the site. During the 1920s the original school building was burned down and the residential houses were demolished and they were replaced with a two-story elementary school building, a cafeteria building, five temporary classrooms, and a parking lot. In the 1950s several temporary classrooms were added and removed. In the late 1960s a Kindergarten building was constructed on the eastern portion of the site. In the early 1970s the Kindergarten building was removed and replaced with five portable buildings, which were later removed in the late 1970s. In the early 2010s the eastern portion of the parking lot on the site was fenced-off and used as the restricted parking of the Oakland School Police Department (OSPD), and a storage building was constructed in the northeastern corner of the site.
- On November 19th, 2019, Peter Sims of Ninyo & Moore conducted a site reconnaissance of the property. The reconnaissance involved a visual inspection of the site, and observations of adjoining properties. At the time of the reconnaissance, the approximate 2.59-acre site was developed with a two-story school building, a cafeteria building, a storage building, and a parking lot. According to Colland Jang, the site representative, the school building was used as an elementary school (Cole Elementary) until approximately 10 years ago. The OUSD special education program occupies the first floor of the school building and approximately 1/3 of the second floor as well as the former cafeteria building, while the OSPD occupies approximately 2/3 of the second floor.
- Interior construction materials included carpeting, ceramic floor tiles, painted and textured plaster walls, and plaster ceilings. Interior finishes appeared to be in good condition.
- The exterior of the buildings consisted of an asphalt parking area on the north side of the building.
- The areas surrounding the site consist primarily of residential buildings to the east south, and west, and an industrial building and a park to the north.
- Based on our site visit, there are currently no wells on the site.

- Ninyo & Moore did observe quantities of hazardous substances or petroleum products used or stored on site during our site reconnaissance. Diesel fuel that supplies the back up generator is stored within the back up generator.
- In August 1998 a 2,000-gallon heating oil tank, reportedly used to fuel the on-site boilers, was removed from the southern portion of the site by ACC Environmental Consultants (ACC). Soil samples were analyzed and only low to no concentrations of contaminants were detected in the soil. ACC recommended no further investigation. This is considered a HREC to the site.
- Indications of underground storage tanks (USTs), or hazardous material spills or leaks, were not observed during the site reconnaissance. The diesel fuel for the back up generator is stored in an aboveground storage tank (AST) inside the generator.
- In 1993 two 10,000-gallon petroleum fuel oil USTs and one 750-gallon diesel UST were removed from the California Cereal Products/Nabisco Brands Inc property located at 1267 14th Street, to the adjacent to the north of the site.
- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides (OCPs), may be found in the soil surrounding the buildings. This is considered a REC.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. This is considered a REC.
- Naturally occurring asbestos (NOA) can be found in some rocks, sediments, and soils throughout the world. According to the geotechnical report completed for the site included in Appendix D, there is no mapped sources of NOA in the site or site vicinity, therefore it is not considered a REC.
- In 1994, at the California Cereal Products/Nabisco Brands Inc property, five 55-gallon, two 30-gallon, and two 5-gallon containers of unknown substances were dumped and burned on the railroad tracks. The property is located downgradient of the site, to the north, at 1267 14th Street. The spill occurred approximately 300 feet north of the site. This was labeled as illegal dumping and Oakland Terminal Railroad took responsibility for the cleanup. Due to the exact location of the dumping being unknown, the quantity and type of contaminant being unknown, the fact that a clean up was completed, and that the dumping took place downgradient from the site, this is not considered a REC to the site.
- Review of an environmental database report obtained for this project indicated that the site is listed on several of the regulatory databases researched by Environmental Data Resources Inc. (EDR), including the CERS, EMI, HAZNET, and FINDS databases. The site is listed on the EMI database for emitting small amounts of organic hydrocarbon gases, carbon monoxide, oxides of Nitrogen and Sulfur, and particulate matter, from 2013 to 2017. The site is listed on the HAZNET database for disposing of several tons of

asbestos containing waste from 1992 to 2015. The site is also listed on the HAZNET database for disposing of 1.168 tons of polychlorinated biphenyls (PCBs) in 1994.

- Several off-site facilities were located within the EDR search radius from the site. None of the listed facilities are considered to be a REC to the site at this time based on several factors, including distance from the site, location relative to the regional groundwater flow direction (e.g. hydraulically downgradient or crossgradient to the site), database listing type, and affected media (soil only). Refer to Section 5.1.2 for additional information regarding potential off site facilities of concern.
- Based on the completion of the Vapor Encroachment Condition (VEC) screening matrix, it is presumed unlikely that a VEC currently exists beneath the site.

9.2. Conclusions

Ninyo & Moore has performed this ESA in conformance with the scope and limitations of ASTM E1527-13 of the OUSD Central Administrative Center property located at 1011 Union Street in Oakland, California. Based on the information compiled during the preparation of this report, this assessment has revealed no evidence of RECs in connection with the site at this time.

- The UST removed from the site by ACC Environmental Consultants in August 1998 represents a HREC to the site.
- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides (OCPs), may be found in the soil surrounding the buildings. This is considered a REC to the site.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. This is considered a REC to the site.

9.2.1. RECs

- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides (OCPs), may be found in the soil surrounding the buildings. This is considered a REC to the site.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. This is considered a REC to the site.

9.2.2. CRECs

CRECs were not identified during the preparation of this report.

9.2.3. HRECs

The following HRECs were identified during the preparation of this report.

- The UST removed from the site by ACC Environmental Consultants in August 1998 represents a HREC to the site.

9.2.4. De Minimis Conditions

De minimis conditions were not identified during the preparation of this report.

9.3. Recommendations

Based on the findings of this ESA, further investigation is recommended at this time.

- Based on the age of the site buildings, lead from lead based paint, arsenic, and organochlorinated pesticides, may be found in the soil surrounding the buildings. Soil samples should be collected around the perimeter of the buildings and analyzed for lead, arsenic, and OCPs.
- A waste incinerator is located in the basement on the site and could be a source of metals or semi-volatile organic compound (SVOC) contamination. Soil samples should be collected immediately adjacent to the incinerator and analyzed for metals and SVOCs.

9.4. Limiting Conditions/Deviations

This report was prepared in accordance with ASTM E1527-13. No deviations from the standard occurred in this ESA. Based on the information gathered by Ninyo & Moore for the purposes of this ESA, it is Ninyo & Moore's opinion the data obtained from the site reconnaissance, records reviewed, and interviews conducted, is adequate to make a conclusion on the environmental condition of the site with respect to the existence or lack of RECs associated with the site.

10. ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined by 312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Site Assessor

Luke I. Swickard
Staff Environmental Scientist

Senior Reviewer

Peter Sims

RESUMES

LUKE I. SWICKARD

Staff Environmental Scientist

EDUCATION

B.S., Environmental Science and Management, 2017, University of California, Davis

EXPERIENCE HIGHLIGHTS

Phase I and II Environmental Site Assessments

Storm Water Pollution Prevention Plans (SWPPP)

Underground Telecommunication Vault Sampling

Hazardous waste handling, storage and facility auditing

PROFESSIONAL AFFILIATIONS

As a Staff Environmental Scientist, Mr. Swickard conducts Phase I Environmental Site Assessments and assists with the planning and implementation of Phase II soil, soil gas, and groundwater investigations. Past project types have included single-family residential developments, commercial facilities, city redevelopment areas, and large scale agricultural lands.

REPRESENTATIVE PROJECT EXPERIENCE

Former Richmond Hospital, Richmond, California: Provided project support for the completion of a Phase I Environmental Site Assessment (ESA) of the former Richmond Hospital for potential redevelopment. Ninyo & Moore conducted the Phase I ESA to evaluate the potential for Recognized Environmental Conditions (RECs) on or adjacent to the site. Phase I ESA Activities included reviewing historical and regulatory environmental data, conducting a site reconnaissance and preparing the Phase I ESA Report.

Floating Photovoltaic (PV) Solar Array, Windsor, California: Provided project support for the completion of a Phase I Environmental Site Assessment (ESA) of a proposed floating PV solar array on an existing water treatment facility. Ninyo & Moore conducted the Phase I ESA to evaluate the potential for Recognized Environmental Conditions (RECs) adjacent to the site so that electrical infrastructure could be installed from the floating PV solar array to a collection system. Phase I ESA Activities included reviewing historical and regulatory environmental data, conducting a site reconnaissance and preparing the Phase I ESA Report.

Multi-family Housing Project, Mountain View, California: Provided project support for the completion of a Phase I Environmental Site Assessment (ESA) on a multi-family housing complex to evaluate the potential for Recognized Environmental Conditions (RECs) on and adjacent to the site for planned redevelopment of the property. Phase I ESA Activities included reviewing historical and regulatory environmental data, conducting a site reconnaissance and preparing the Phase I ESA Report.

Agricultural land, Capay Valley, California: Provided project support for the completion of a Phase I Environmental Site Assessment (ESA) on an approximate 310-acre agricultural property that is utilized for cattle grazing and olive orchards. The Phase I ESA was conducted to evaluate the potential for Recognized Environmental Conditions (RECs) on and adjacent to the site for on-gong use of the property. Phase I ESA Activities included reviewing historical and regulatory environmental data, conducting a site reconnaissance and preparing the Phase I ESA Report.

PETER SIMS

PROJECT ENVIRONMENTAL GEOLOGIST

EDUCATION

B.A., Geology, 2006, University of California, Davis

REGISTRATIONS AND CERTIFICATIONS

OSHA 40-Hour Health & Safety Training with Annual Updates

OSHA 8-Hour Supervisor Training

OSHA Excavation Competent Person

EXPERIENCE HIGHLIGHTS

Phase I ESAs

Phase II Subsurface Investigations

Sampling Surveys

Installation and Development of Groundwater Monitoring Wells

PEA soil sampling

Pesticide and aerially deposited lead in soil sampling

As Project Environmental Geologist for Ninyo & Moore, Mr. Sims' is responsible for writing reports and conducting associated fieldwork for a variety of environmental projects, including Soil and Groundwater Management Plans; Phase I and Phase II Environmental Site Assessments; groundwater remediation; and soil remediation. His fieldwork experience includes air, soil and groundwater sample collection, groundwater monitoring well installations/destructions, soil-vapor well installation and monitoring, and remediation system installation and maintenance. Through the course of his work, Mr. Sims has become adept at communicating with clients and regulatory agencies, safely and efficiently performing fieldwork, analyzing and compiling data, writing reports and managing his time.

REPRESENTATIVE PROJECT EXPERIENCE

East Bay Regional Parks District (EBRPD), Eastshore Park/Berkeley Brickyard, Stockpile Sampling and Reporting, Berkeley, California: Project Manager for preparation and performing sampling of a 250,000 cubic yard stockpile in two phases as well as reporting to evaluate the suitability of the stockpiled soil for reuse at the Point Pinole Regional Shoreline under EBRPD requirements and for reuse at the various Eastshore Park properties under the Regional Water Quality Control Board cleanup requirements. Activities conducted included soil sampling and report writing.

Oakland Unified School District, Downtown Education Complex/Pipeline Risk Assessment (PRA), Railroad Safety Study (RSS), Removal Action (RA) Implementation, and Operations & Maintenance (O&M) Activities, Oakland, California: Performed a PRA and RSS under California Department of Toxic Substances Control (DTSC) oversight to evaluate suitability of the site for use as a school. Project Manager for RA implementation and O&M activities under DTSC oversight to address environmental conditions revealed in previous environmental investigations. Activities conducted include historical research, regulatory file reviews, interviews, report writing, soil vapor well installation, and soil and soil vapor sampling.

Resources for Community Development, Ashland Housing Project, Phase I Environmental Site Assessment (ESA), Phase II ESA, Interim Removal Action Plan (IRAP) Preparation and Implementation, Ashland, California: Project Manager for preparation of a Phase I ESA, Phase II ESA, and IRAP as well as implementation of the IRAP under Alameda County Department of Environmental Health (ACDEH) oversight to evaluate the suitability of the site for redevelopment as low-income housing. Activities conducted included historical research, regulatory file reviews, interviews, soil sampling, impacted soil excavation oversight, and report writing.

Former Bill Chun Service Station, Soil, Soil Vapor, and Indoor Air Sampling, Groundwater Monitoring, Site Investigation (SI) Report, Corrective Action Plan (CAP), O&M Plan, Alameda, California: Project manager and field staff for sampling of soil, soil vapor, indoor air and groundwater and provided oversight of groundwater monitoring well installation under ACDEH oversight. Project manager for preparation of multiple semi-annual groundwater monitoring reports, an SI Report, a CAP detailing enhanced bioremediation by groundwater recirculation, and an O&M Plan for remediation of a release from former underground storage tanks.

City of Oakland Public Works Agency On Call Environmental Services Contract, Oakland, California: Project manager for the City of Oakland On-Call Environmental Services contract. The scope of services for the contract includes preparation of Phase I and Phase II ESAs for evaluation of soil to be disturbed in the maintenance of sewers and storm drains.

Kristopher M. Larson, PG, QSD/QSP

Principal Environmental Geologist

EDUCATION

B.S., Geology, 1996, San Francisco State University

REGISTRATIONS/CERTIFICATIONS

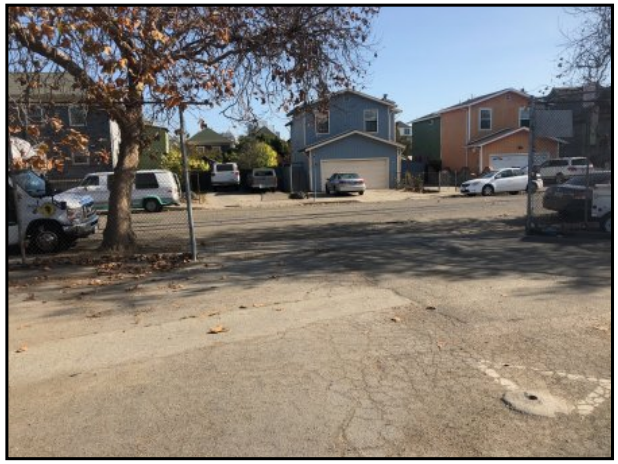
PG 8059 (California)

Qualified SWPPP Practitioner (QSP) and Qualified SWPPP Developer (QSD), #20715 (California)

As a Principal Environmental Geologist for Ninyo & Moore, Mr. Larson has 25 years of environmental experience. He is the Operations Manager for environmental services in Ninyo & Moore's Alameda office and his areas of expertise include Brownfields investigations and remediation, transactional environmental due diligence, subsurface site characterization, storm water management, site remediation and construction/ demolition planning and supervision. Prior to joining Ninyo & Moore, Mr. Larson worked as an environmental specialist at the San Francisco Bay Regional Water Quality Control Board (RWQCB). He has worked closely with all local, state and federal environmental agencies, including the California EPA Department of Toxic Substances Control (DTSC), United States Environmental Protection Agency (US EPA), RWQCB, Army Corps of Engineers, and numerous local oversight programs.

EXPERIENCE

Oakland Unified School District, Downtown Campus, Oakland, California: Principal-In-Charge responsible for technical oversight which included working closely with the DTSC in preparing a Preliminary Site Investigation (PSI), Supplemental Site Investigation (SSI), and Remedial Action Plan (RAP) for investigation and remediation of metal and petroleum impacted soil on the site property. Mr. Larson was involved in report review and project oversight, as well as client correspondence. The plan development for this site is the construction of two intermediate schools and an administrative building.



Oakland Unified School District, Oakland, California: Principal-In-Charge responsible for technical oversight of numerous OUSD projects including La Escuelita Education Center, Life Academy and the Calvin Simmons School. A Phase I Environmental Site Assessment (ESA) was prepared for each of these facilities, and a Phase II ESA was prepared for the Calvin Simmons School. At the La Escuelita and Life Academy facilities we worked closely with the Department of Toxic Substances Control in preparing a Preliminary Environmental Evaluations (PEA) and Supplemental Site Investigation. We also prepared a pipeline risk analysis, an indoor air sampling event and a Remedial Action Plan for investigation and remediation of metal and petroleum impacted soil for La Escuelita. Mr. Larson's responsibilities included report review and project oversight, as well as client and regulatory correspondence.

Oakland Unified School District, Downtown Education Complex, Phase I ESA, PRA, RSS, PEA, SSI & Removal Action Workplan (RAW): Principal-In-Charge responsible for for a Phase I ESA, PEA, SSI, RAW preparation and implementation under DTSC oversight to evaluate suitability and prepare the site for use as a school. Activities conducted include evaluation of potential hazards associated with multiple large diameter natural gas transmission lines, high volume water lines, and petroleum product pipelines in the site vicinity; evaluation of potential hazards associated with the presence of railroad tracks in the site vicinity which are also adjacent to petroleum pipelines; PEA and SSI work plan preparation; soil, groundwater, soil vapor and indoor air sampling to evaluate contamination from metals in shallow soil and contamination from petroleum products associated with on-site and off-site leaking USTs; risk assessment preparation; RAW preparation including coordinating public participation; oversight of remediation activities; and preparation of a Remedial Action Completion Report.

Oakland Unified School District, Phase I Environmental Site Assessment (ESA), Life Academy High School, Oakland, California: Principal Environmental Geologist providing technical consultation for Phase I ESA at the high school site.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 07/19/2019 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 07/19/2019 has revealed that there are 4 SEMS sites within approximately 0.5 miles of the target property.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/19/2019 has revealed that there are 5 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/24/2019 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/24/2019 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/24/2019 has revealed that there are 8 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/29/2019 has revealed that there are 87 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 46 LUST sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 16 CPS-SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there is 1 UST site within approximately 0.25 miles of the target property.

State and tribal voluntary cleanup sites

VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the VCP list, as provided by EDR, and dated 07/29/2019 has revealed that there are 16 VCP sites within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/24/2019 has revealed that there are 15 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

HIST CORTESE: The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.

A review of the HIST CORTESE list, as provided by EDR, and dated 04/01/2001 has revealed that there

are 37 HIST CORTESE sites within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste.

EXECUTIVE SUMMARY

Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
PG AND E OAKLAND	50 MARKET ST BTWN 1S	SSE 1/2 - 1 (0.725 mi.)	AS192	785
PG AND E GAS PLANT O	FIRST AND WASHINGTON	SE 1/2 - 1 (0.969 mi.)	233	927

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills
This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 05/14/2019

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

OUSD CENTRAL ADMINISTRATIVE CENTER
1011 UNION STREET
OAKLAND, CA 94607

TARGET PROPERTY COORDINATES

Latitude (North):	37.807958 - 37° 48' 28.65''
Longitude (West):	122.289605 - 122° 17' 22.58''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	562535.1
UTM Y (Meters):	4184540.2
Elevation:	20 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5641112 OAKLAND WEST, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

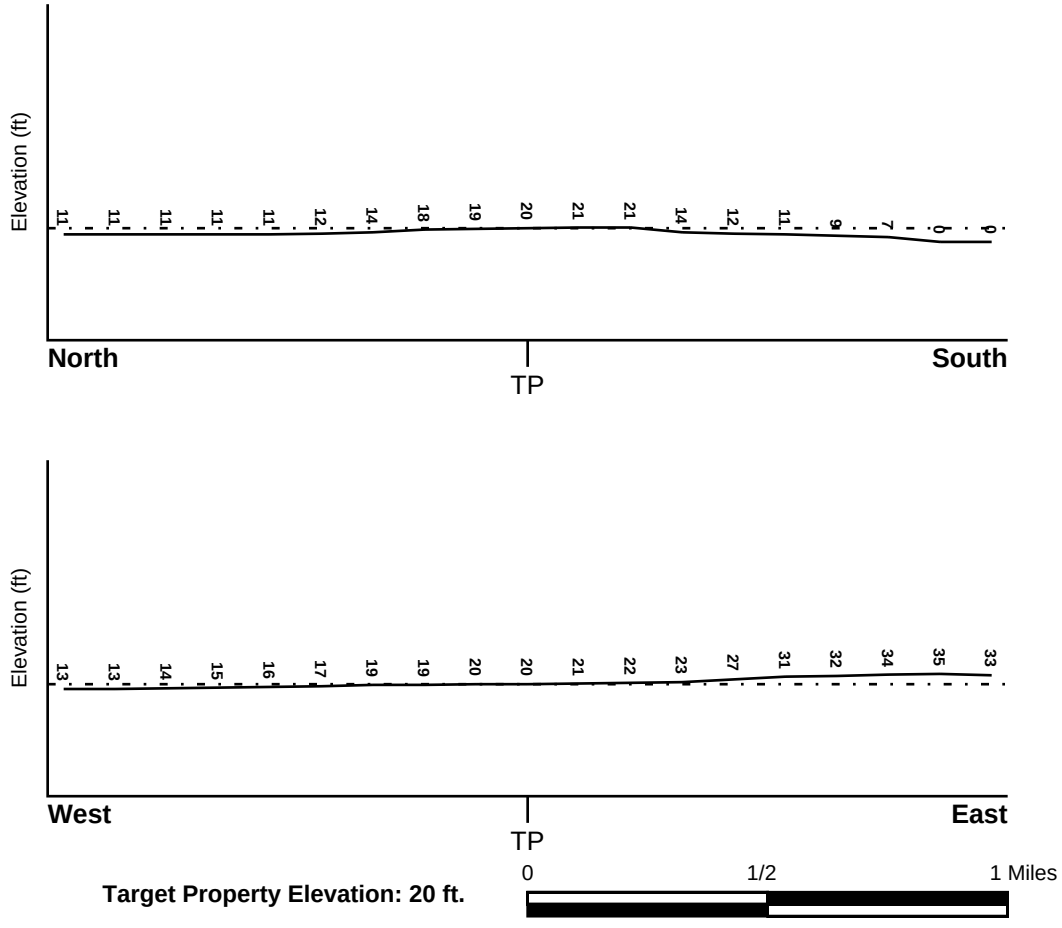
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06001C0066G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06001C0058G	FEMA FIRM Flood data

06001C0067G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
OAKLAND WEST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

AREA RADON INFORMATION

State Database: CA Radon

Radon Test Results

Zipcode	Num Tests	> 4 pCi/L
94607	3	0

Federal EPA Radon Zone for ALAMEDA County: 2

Note: Zone 1 indoor average level > 4 pCi/L.
: Zone 2 indoor average level >= 2 pCi/L and <= 4 pCi/L.
: Zone 3 indoor average level < 2 pCi/L.

Federal Area Radon Information for ALAMEDA COUNTY, CA

Number of sites tested: 49

Area	Average Activity	% <4 pCi/L	% 4-20 pCi/L	% >20 pCi/L
Living Area - 1st Floor	0.776 pCi/L	100%	0%	0%
Living Area - 2nd Floor	-0.400 pCi/L	100%	0%	0%
Basement	1.338 pCi/L	100%	0%	0%

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: A review of the NPL list, as provided by EDR, and dated 07/19/2019 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

OUSD CENTRAL ADMINISTRATIVE CENTER
1011 UNION STREET
OAKLAND, CA 94607

TARGET PROPERTY COORDINATES

Latitude (North):	37.807958 - 37° 48' 28.65''
Longitude (West):	122.289605 - 122° 17' 22.58''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	562535.1
UTM Y (Meters):	4184540.2
Elevation:	20 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5641112 OAKLAND WEST, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

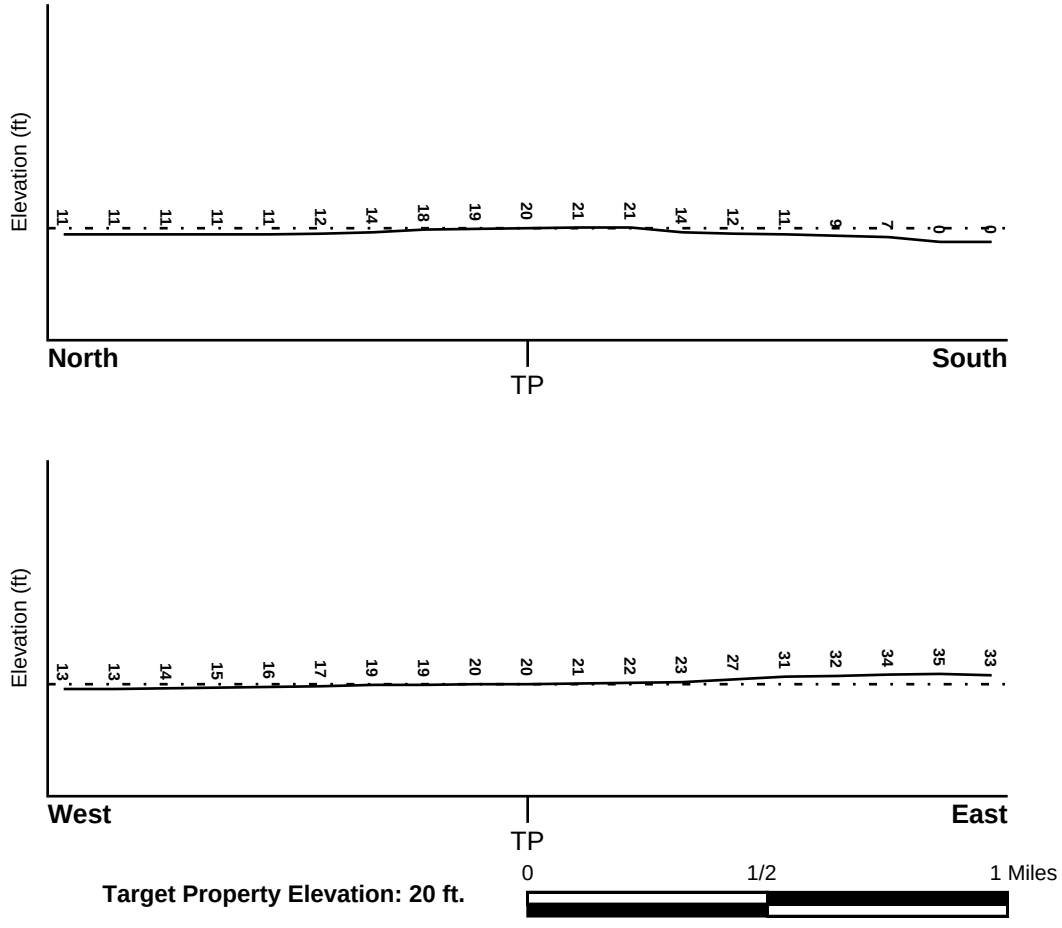
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06001C0066G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06001C0058G	FEMA FIRM Flood data
06001C0059G	FEMA FIRM Flood data
06001C0067G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
OAKLAND WEST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

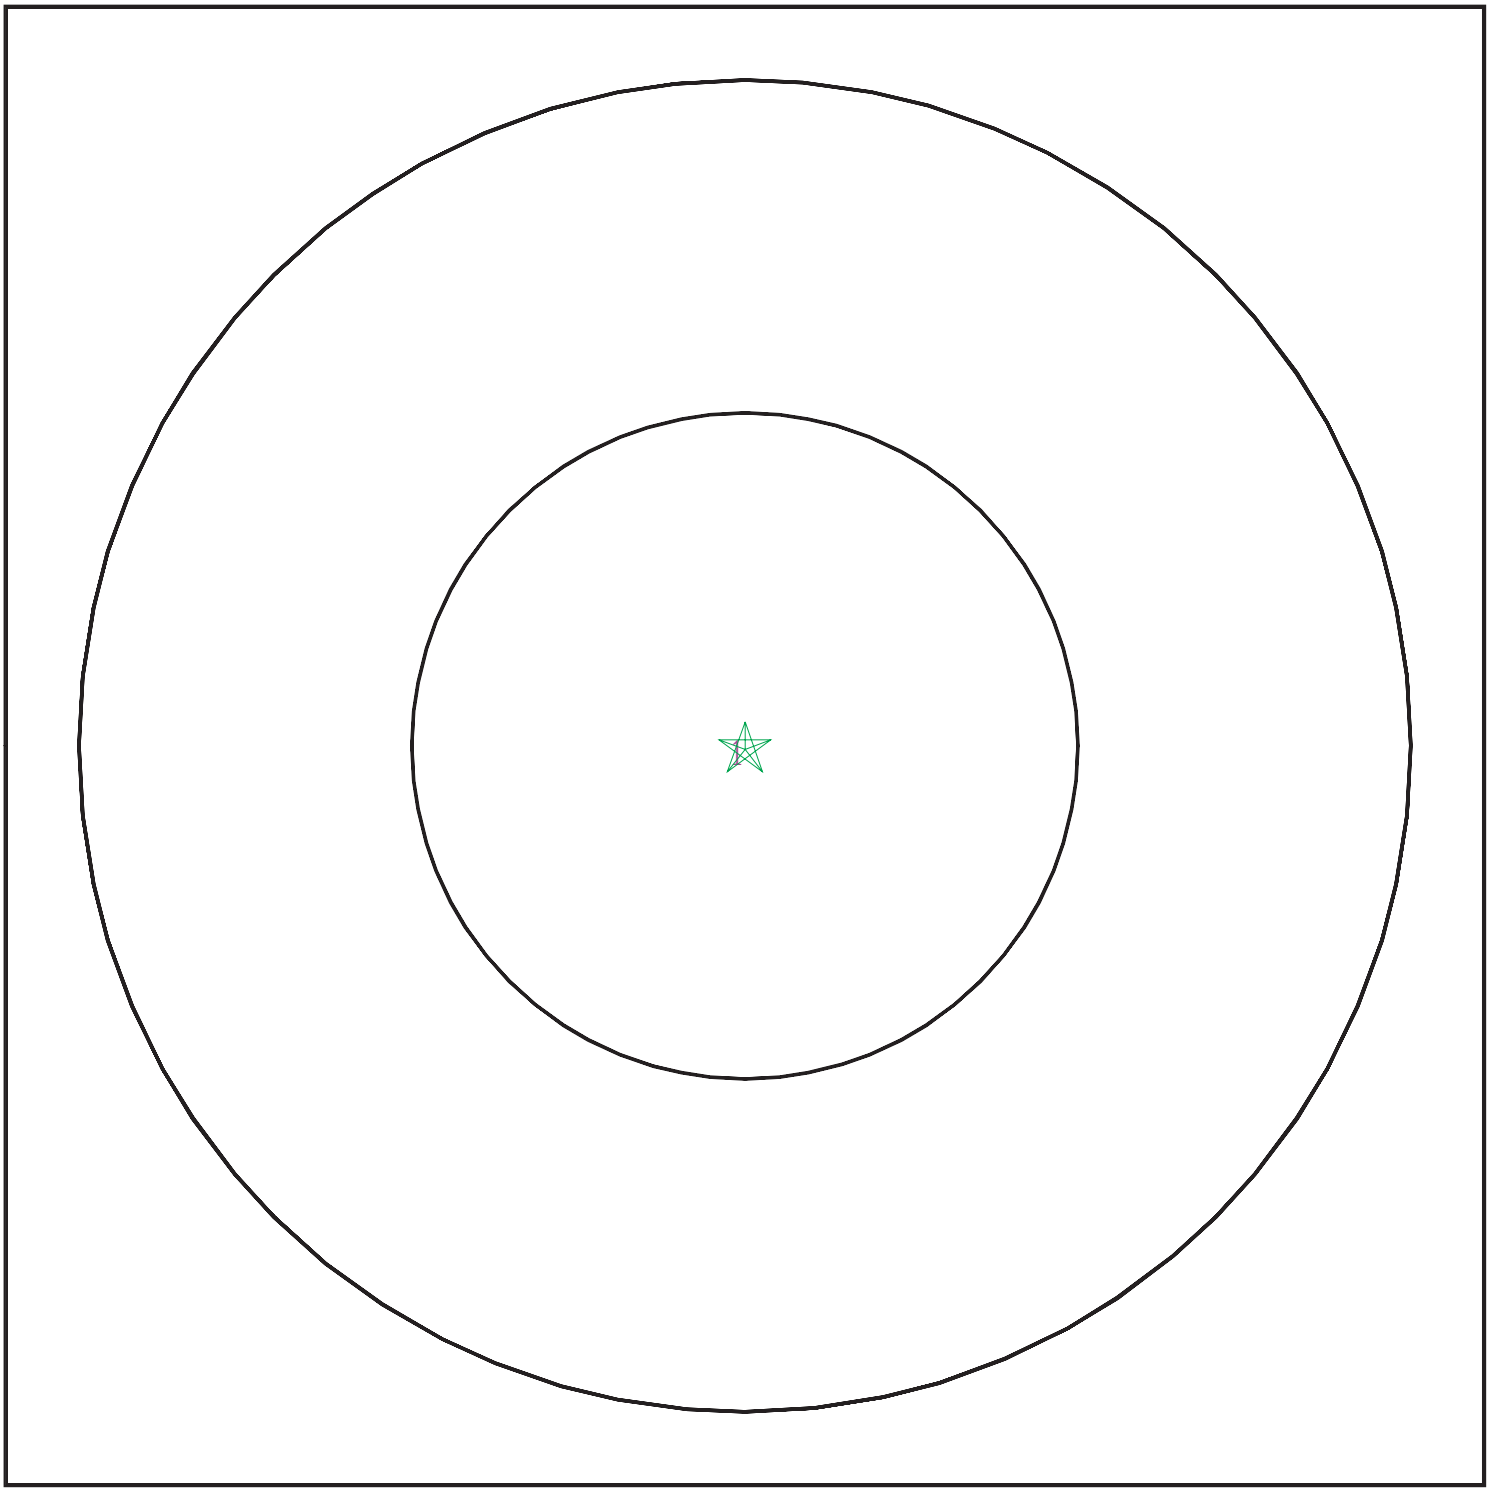
GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT



Era:	Cenozoic
System:	Quaternary

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW[R] Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Re: Underground Storage Tank Closure Report
Cole Elementary School, 1011 Union Street, Oakland, California
School No 109, *ACC Project No. 97-6287-006.01* 94607

Dear Mr. Nakadegawa:

Enclosed please find one original and one copy of the underground storage tank (UST) closure report for the former heating oil UST located at Cole Elementary School, Oakland, California (Figure 1B). A copy of this report is being forwarded to Mr. Leroy Griffin of the Oakland Fire Services Agency (OFSA) on your behalf.

BACKGROUND

One 2,000-gallon heating oil UST was located beneath the concrete pavement adjacent to 10th Street, next to the sidewalk. The UST was previously used to store heating oil for the boilers on site. The UST was removed because it is no longer used and not in compliance with current regulations. Upon inspection, the UST contained a minimum of 2,000 gallons of heating oil. Figure 2C illustrates the location of the former UST.

OBSERVATIONS

Before performing any field activities, appropriate permits were obtained and the OFSA was notified. The UST removal and backfill work was performed by state licensed contractor Accutite Environmental Engineering (Accutite) under contractor's license number 643881, in accordance with regulatory requirements. ACC documented the subsurface work during the UST removal and closure procedures. The work was observed by Mr. Leroy Griffin of the OFSA.

FIELD ACTIVITIES

Prior to the UST removal, approximately 2,000 gallons of product were pumped from the UST. The top of the UST and product lines were found approximately 6.0 feet below ground surface (bgs). The bottom of the UST sat at a depth of approximately 11.0 feet bgs.

On August 21, 1998, personnel from Accutite added approximately 40 pounds of dry ice to inert the UST prior to removal. The lower explosion limit and the percent oxygen of the UST were determined using a GasTech combustible gas indicator calibrated to Hexane. Mr. Griffin of the

OFSA witnessed the GasTech inspection. When the vapors within the UST were less than 10 percent of the lower explosion limit and upon OFSA approval, the UST was removed with the use of an excavator.

Upon removal, the UST was found to be constructed of single-walled riveted steel and in poor condition. The UST was observed to be rusty with multiple, small holes. The UST was loaded onto a truck and hauled by Erickson, Inc., Richmond, California under manifest number 96633311 for disposal. A copy of the UST manifest is attached. Once transported to the Erickson facility, the UST was cleaned and rendered harmless.

The soil observed within the excavation consisted of sand. During removal of the UST, no indications of impact (i.e., odor or discoloration) were observed in the soil in the excavation.

After removal of the UST, two soil samples were collected at the approximate location of the UST fill port at 11.0 feet bgs, the approximate elevation of the bottom of the former UST. Sample 109-T1F-11.0 was collected from the sidewall of the tank, as was sample 109-T1-11.0. During the UST removal, approximately 100 cubic yards of soil were generated and stockpiled on site and covered with plastic sheeting. Samples 109-SP (A,B) and 109-SP (C,D) were taken from the stockpiled soil. The samples were submitted to Chromalab, Inc. (Chromalab), a state-certified analytical laboratory following chain of custody protocol.

After collection, all samples were immediately covered with Teflon® tape and tight fitting plastic end caps, labeled, and submitted to Chromalab, Inc. The soil samples were analyzed in accordance with the sampling protocol approved by the OFSA. The analyses included total petroleum hydrocarbons as diesel (TPHd) by EPA Method 8015M and benzene, toluene, ethylbenzene, and total xylenes (BTEX) by EPA Method SW846 8020A Nov 1990 . Laboratory analytical results are summarized in Table 1. A copy of the laboratory analytical results and chain of custody record is attached.

TABLE 1 - SOIL SAMPLE ANALYTICAL RESULTS

Sample No.	TPHd (mg/kg)	Benzene (mg/kg)	Toluene (mg/kg)	Ethylbenzene (mg/kg)	Total Xylenes (mg/kg)
109-T1F-11.0	1.4	<0.005	<0.005	<0.005	<0.005
109-T1-11.0	<1.0	<0.005	<0.005	<0.005	<0.005
109-SP (A-D)	<1.0	<0.005	<0.005	<0.005	0.016

Notes: mg/kg = milligrams per kilogram = ppm = parts per million

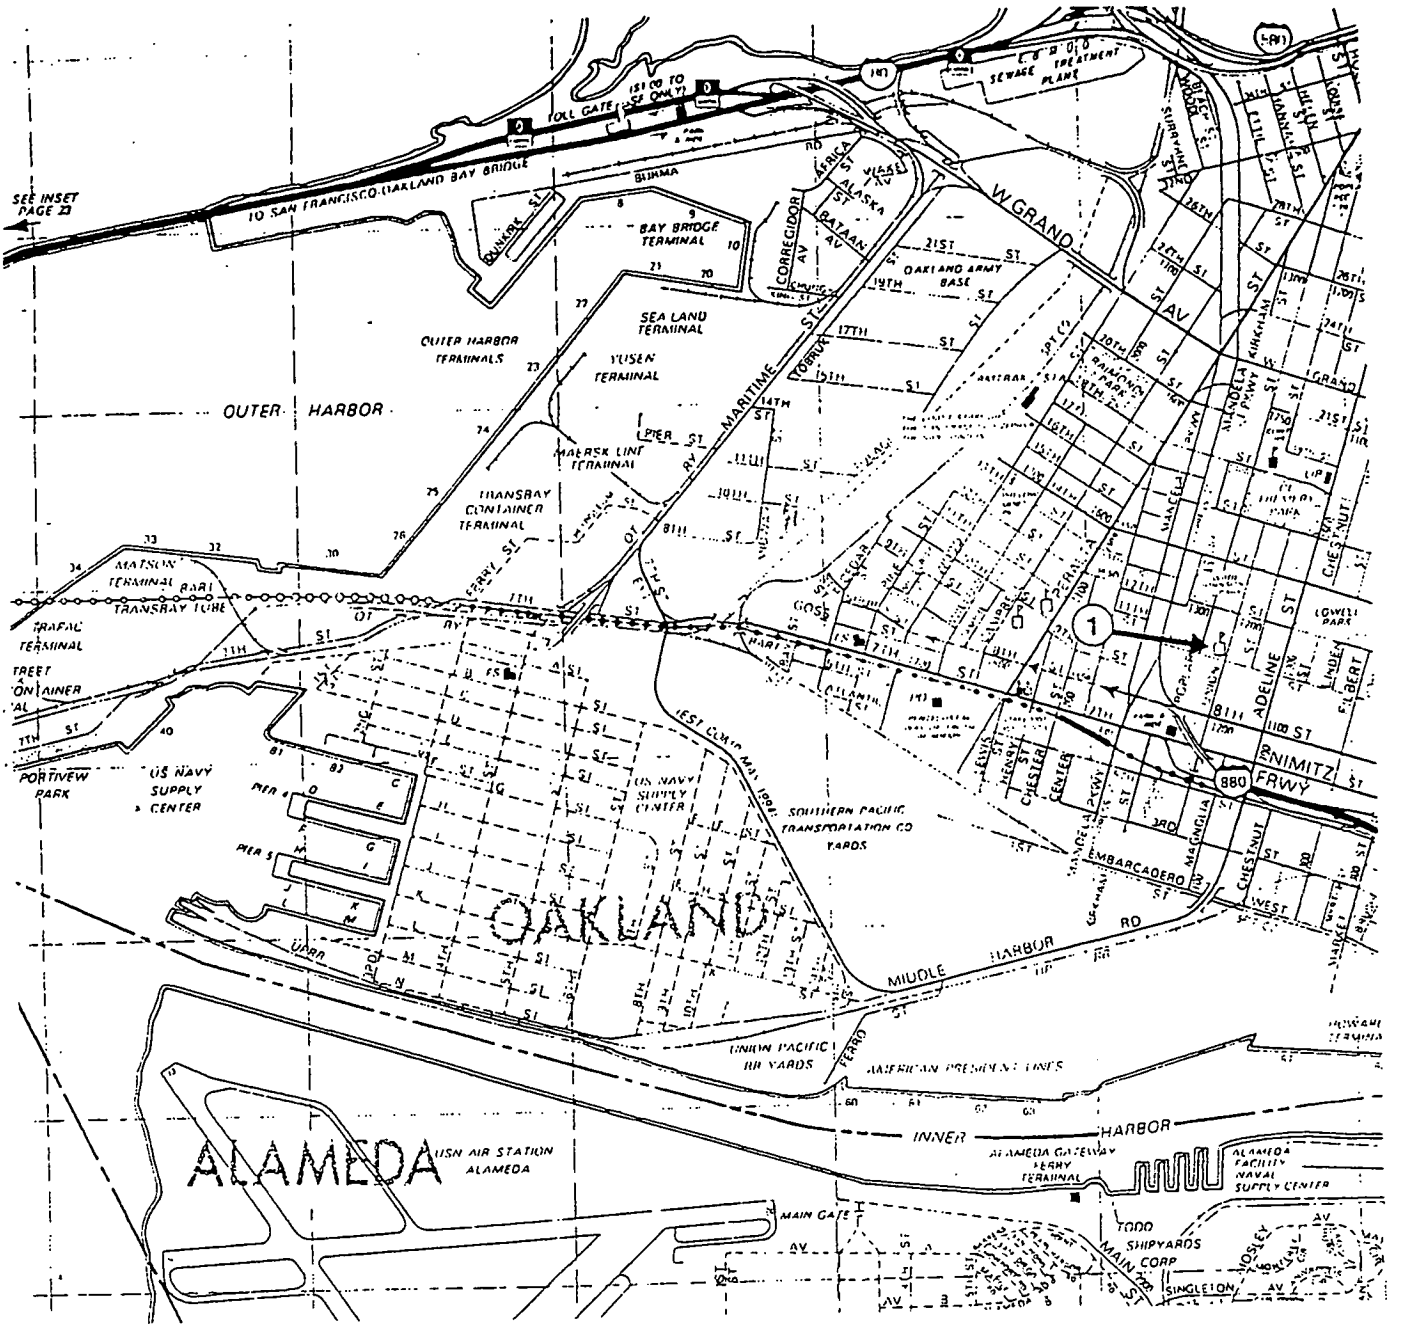
CONCLUSIONS

ACC observed that existing concrete sidewalk adjacent to the UST was thin (approximately 2 inches), of poor quality, and easily damaged. Concrete damage occurred during UST removal work that could not have been anticipated and was not due to negligence by the Contractor. Consequently, additional concrete pavement required replacement to properly restore the site.

During removal, the UST was found to be in poor condition with numerous visible holes; however, indications of petroleum hydrocarbons were not observed in the soil. Analytical results of the soil samples collected from under the former UST and from soil removed from the excavation indicated low detectable concentrations of petroleum hydrocarbons above the reporting limits.

Due to field observations and the lack of significant concentrations of constituents reported in the soil samples, no subsurface impact from underground storage of petroleum hydrocarbons is apparent. Based on the findings, observations, and analytical results, no further investigation with regards to the former UST is warranted.

If you have any questions, please feel free to contact me at (510) 638-8400.



Sincerely,

David R. DeMent, RG
Senior Geologist

Oakland, CA Public Records

Hi there

A message was sent to you regarding record request #19-6040:

Please contact Alameda County Dept. of Environmental Health regarding hazardous materials (CUPA) records at http://www.acgov.org/aceh/hazard/cupa-file-review-request.htm On 6/30/15, Oakland Fire Dept. regulation of hazardous materials facilities and CUPA records were transferred to Alameda County.

The Fire Prevention Bureau will search for tank records.

UTILITIES/DISCHARGES

Is the property served, or has the property been served, by a private water well?

___Yes __X__ No ___Unknown

If yes, is groundwater under the property used as a source of drinking water?

___Yes __X__ No ___Unknown

Has the water from the well ever been tested? (If YES, please provide test results)

___Yes __X__ No ___Unknown

Has the well water been identified as contaminated by any governmental agency?

___Yes __X__ No ___Unknown

Are there any groundwater monitoring wells or irrigation wells on the property?

___Yes __X__ No ___Unknown

If Yes, how many____ and when were they installed?_____

Does the property discharge waste water, or storm water into a municipal sanitary sewer system? If Yes, does the facility discharge under an NPDES Permit or Waste Discharge Permit?

___Yes __X__ No ___Unknown Permit Number/Agency:_____

Are there any current or previous sumps used for waste-water collection/treatment on the property?

___Yes __X__ No ___Unknown

Are there any septic systems, dry wells or leach fields on the property?

___Yes __X__ No ___Unknown If Yes, Where?:_____

ENVIRONMENTAL COMPLIANCE

Is there knowledge of environmental liens or governmental notification or involvement relating to past or current use or disposal of hazardous substances?

___Yes __X__ No ___Unknown

Is there any environmental litigation, administrative action or cleanup action involving the property related to a release or threatened release of any hazardous substance or petroleum product?

___Yes __X__ No ___Unknown

Has the property or related facilities or operations ever been the subject of enforcement actions by governmental authorities resulting in penalties of any kind?

___Yes __X__ No ___Unknown

ENVIRONMENTAL CONDITIONS

Has groundwater or soils on the property ever been tested?

___Yes __X__ No ___Unknown

If Yes, provide details:

_____

Have any contaminants been identified which exceed standards or guidelines levels?

___Yes __X__ No ___Unknown

If Yes, provide details:

_____

BUILDING CONDITIONS

What is/are the age of the structure(s)? 94yrs(Main Bldg).

Have any major renovations been completed and if so, describe type and when completed:

1949 New Cafeteria; 1973 Main Building Modernization; 2011 New Portable

Has an asbestos and/or lead-based paint survey been performed on the site structure(s)?

_X_Yes ____ No ___Unknown

If Yes, was asbestos containing materials identified?

_X_Yes ____ No

If Yes, was lead-based paint present identified?

_X_Yes ____ No

PHASE I ESA/AAI REQUIREMENTS

According to the All Appropriate Inquiry (AAI, 40 CFR 312) requirements and ASTM (E 1527-05) guidance on conducting Phase I Environmental Site Assessments, the "user" of the assessment must provide the following information, if available, to the environmental professional in order to qualify for Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001. Please check yes or no and provide any additional information you may have regarding the site. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

(1) Environmental cleanup liens that are filed or recorded against the site (40 CFR 132.25).
Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state, or local law?

☐ Yes ☑ No

If yes, please explain:

(2) Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).
Are you aware of any activity use limitations (AULs), such as engineering controls, land use restrictions, or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

☐ Yes ☑ No

If yes, please explain:

(3) Specialized knowledge or experience of the person/department requesting the Phase I ESA and seeking to qualify for the landowner liability protections (40 CFR 312.28).
As the user of this ESA, do you have any specialized knowledge or experience related to the property or adjoining properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☐ Yes ☑ No

If yes, please explain:

(4) Relationship of the purchase price to the fair market value of the property, if it were not contaminated (40 CFR 312.29).
Does the purchase price offered for this property reasonably reflect the fair market value of the property? If there is a difference between the purchase price and the fair market value, have you considered whether the lower purchase price is because contamination is known or believed to be at the property?

Please discuss: not applicable

(5) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).
Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,
(a) Do you know the past uses of the property? no
(b) Do you know of specific chemicals that are present or once were present at the property? no
(c) Do you know of spills or other chemical releases that have taken place at the property? no
(d) Do you know of any environmental cleanups that have taken place or are ongoing at the property?

☐ Yes ☑ No

If yes, please explain:

(6) The degree of obviousness of the presence or likely presence of contamination at the property and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
As the user of this ESA, based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?

☐ Yes ☑ No

If yes, please explain:

Appendix F:

VAPOR ENCROACHMENT SCREENING MATRIX

Phase I ESA Vapor Encroachment Conditions (VEC) matrix includes a (1) Search Radius Test, (2) Chemicals of Concern Test (COC), and (3) a Critical Distance Test [1].

(1) Search Radius Test: Are there any known or suspect contaminated properties in the primary area of concern within the corresponding search radii (including the site)?

☐ Yes ☒ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(2) Chemicals of Concern Test: Are COC likely to be present within the area of concern for those known or suspect contaminated sites identified based on the Search Distance Test?

☐ Yes ☒ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(3) Critical Distance Test*: A plume test to determine whether or not COC in the contaminated plume(s) may be within the critical distance.

☐ Yes ☒ No — (3a) Is information related to the contaminated(s) plume available (i.e. isoconcentration maps, site drawings, etc.)?
(3b) If ***No***, then a VEC cannot be ruled out; check ***Yes*** in #4 below indicating it is likely a VEC exists. If ***Yes***, then:

☐ Yes ☒ No — (3c) Is the site less than 100 feet to the nearest edge of a contaminated [non-petroleum hydrocarbon] plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

☐ Yes ☒ No — (3d) Is the site less than 30 feet to the nearest edge of a dissolved petroleum hydrocarbon plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

*If the distance from the nearest edge of a contaminated plume to the nearest existing or planned structure on the site is less than 100 feet for non-petroleum hydrocarbon COC, or less than 30 feet for dissolved petroleum hydrocarbons, then it is presumed that a VEC *currently* exists beneath the site. If the distance from the nearest edge of the contaminated plume is greater than or equal to 100 feet for non-petroleum hydrocarbons, or 30 feet for dissolved petroleum hydrocarbon chemicals of concern, then it is presumed unlikely that a VEC *currently* exists beneath the site.

(4) Is it likely that a VEC *currently* exists beneath the site?

☐ Yes ☒ No — If ***No***, then the VEC screening is complete and no further investigation is recommended at this time. If ***Yes***, Ninyo & Moore recommends performing additional assessment, such as a Tier 2 VEC assessment according to ASTM E 2600-10.

[1] Based on guidance presented in the ASTM E 2600-10 Standard.

EXECUTIVE SUMMARY

Ninyo & Moore Geotechnical and Environmental Sciences Consultants (Ninyo & Moore) prepared this Preliminary Endangerment Assessment (PEA) Report for the Oakland Unified School District (OUSD) and the Department of Toxic Substances Control (DTSC) for the property located at 1011 Union Street in Oakland, California (Site, Figure 1). The PEA work was conducted across the property in consideration for Site redevelopment into a central administration building and parking lot. Ninyo & Moore developed a scope of work included in the PEA Work Plan (Ninyo & Moore, 2021) based on the findings of the Phase I ESA Report and discussions with the DTSC. The PEA evaluated soil and soil gas for potential environmental concerns.

Constituents of Potential Concern (COPCs)	
Media	**Potential Environmental Concern**
Soil	Title 22 Metals, OCPs, PCBs, SVOCs, dioxin/furans, VOCs, TPHg, TPHd, TPHmo and PAHs
Soil Gas	VOCs, Methane, Oxygen, Carbon Dioxide

Notes:
OCPs – organochlorine pesticides
PCBs – polychlorinated biphenyls
SVOCs - semi volatile organic compounds
VOCs – volatile organic compounds
TPHd – total petroleum hydrocarbons as diesel
TPHmo – total petroleum hydrocarbons as motor oil
TPHg - total petroleum hydrocarbons as gasoline
PAHs – polynuclear aromatic hydrocarbons

Metals and dioxin/furans concentrations exceeding screening levels were identified in soil.

- The upper limit arsenic background concentration for the Site was estimated to be 14.20 mg/kg. Only 5 of the 124 soil samples collected at the Site contained arsenic at concentrations higher than the estimated local background concentration. Therefore, the distribution of arsenic contamination at the Site appears to be limited and localized. The estimated 95% UCL for arsenic using all available data was estimated to be 7.52 mg/kg (Appendix E).

- Relatively high concentrations of lead were detected in soil at the Site. The estimated 95UCL for lead was estimated to be 181.3 mg/kg (Appendix E). This value exceeds the DTSC (2020) soil screening value for lead of 80 mg/kg. Therefore, it is concluded lead in soil could pose a potential health hazard to future on-Site receptors.

- Using maximum detected soil chemical concentrations, the hazard indices estimated to result from soil exposure or indoor air exposure were estimated to be lower than 1 (Tables 13 and 14). Both estimated hazard indices were within levels considered acceptable to California health and environmental protection agencies.

Ninyo & Moore recommends:

- Evaluate mitigation and/or remediation options with respect to the proposed improvement plans (i.e., building locations, hardscape).

- Prepare a Site-Specific Health and Safety Plan and a Soil Management Plan for any work where contractors shall be working in or excavating soil.

- Delineate lead vertically in AOC 3. Grading is expected during development of the Administration building and soil will be removed and disposed of off-Site. Vertical delineation will determine the distribution of elevated lead concentrations in soil that may be excavated during grading.

- Delineate dioxin/furans in soil vertically and laterally near the boring S4 on the west side of the current two-story building (AOC 1).

1 INTRODUCTION

Ninyo & Moore Geotechnical and Environmental Sciences Consultants (Ninyo & Moore) prepared this Preliminary Endangerment Assessment (PEA) Report for the Oakland Unified School District (OUSD) and the Department of Toxic Substances Control (DTSC) for the property located at 1011 Union Street in Oakland, California (Site, Figure 1). Ninyo & Moore conducted this investigation based our Preliminary Environmental Assessment Work Plan dated October 21, 2021 (Work Plan) and approved by the DTSC in a letter dated October 21, 2021.

2 SITE DESCRIPTION

The Cole Campus Site is developed with a two-story former elementary school building, a former cafeteria building, a storage building, a playground, and two parking lots. The Site is occupied by the District administration personnel and the District Police Department. The Site is situated on one parcel totaling approximately 2.59 acres of land designated by Alameda County Assessor's Parcel Number (APN) 004 005300700. The Site location is presented on Figure 1. Additional Site details, geology, and hydrology are presented below.

2.1 Site Identification

Site Name:	Central Administration Center at Cole Campus
Contact Person:	Elena Comrie
Site Address:	1011 Union Street, Oakland, California
Mailing Address:	1111 Broadway, Suite 300, Oakland, CA 94607
Phone Number:	510.906.2123
Other Site Names:	Not applicable
USEPA Identification Number:	Not applicable
Property Location:	Between 10th Street, 12th Street, and Poplar Street in Oakland, California

2.2 Regional Geology

The Site is located in the Coast Range geomorphic province of California. The Coast Ranges are northwest-trending mountain ranges (2,000 to 4,000, occasionally 6,000 feet elevate above sea level), and valleys. The ranges and valleys trend northwest, subparallel to the San Andreas Fault. Strata dip beneath alluvium of the Great Valley. To the west is the Pacific Ocean. The coastline is uplifted, terraced, and wave-cut. The Coast Ranges are composed of thick Mesozoic and Cenozoic sedimentary strata. The northern and southern ranges are separated by a depression containing the San Francisco Bay. The northern Coast Ranges are dominated by irregular, knobby landslide-topography of the Franciscan Complex. The eastern border is characterized by strike-ridges and valleys in Upper Mesozoic strata. In several areas, Franciscan rocks are overlain by volcanic cones and flows of the Quien Sabe, Sonoma and

Clear Lake volcanic fields. The Coast Ranges are subparallel to the active San Andreas Fault. The San Andreas is more than 600 miles long, extending from Pt. Arena to the Gulf of California. West of the San Andreas is the Salinian Block, a granitic core extending from the southern extremity of the Coast Ranges to the north of the Farallon Islands (CGS, 2002).

The Site is located east of San Francisco Bay in the Coast Ranges Geomorphic Province of California. The Coast Ranges are comprised of several mountain ranges and structural valleys formed by tectonic processes commonly found around the Circum-Pacific belt. Basement rocks have been sheared, faulted, metamorphosed, and uplifted, and are separated by thick blankets of Cretaceous and Cenozoic sediments that fill structural valleys and line continental margins. The San Francisco Bay Area has several ranges that trend northwest, parallel to major strike-slip faults such as the San Andreas, Hayward, and Calaveras faults. Major tectonic activity associated with these and other faults within this regional tectonic framework consists primarily of right-lateral, strike-slip movement (Norris and Webb, 1990).

2.3 Site Geology

Review of available geologic maps and reports indicates that the Site is located in the flatlands west of the base of the Oakland Hills, which is proximal to the San Francisco Bay structural depression to the west. Bedrock underlying the Oakland-San Leandro area and exposed in the hills to the east primarily consists of gabbro and basalt of the Jurassic Coast Range Ophiolite, Late Jurassic-Early Cretaceous Franciscan rocks, Jurassic silicic volcanics and Late Jurassic-Early Cretaceous Knoxville Formation.

The 1977 California Division of Mines and Geology, *Geologic Map of California: (Jennings C.W.)*, shows the Site to be underlain by Quaternary Marine and Non-marine Sand Deposits (Qs). Based on our review of the EDR Radius Map report during preparation of our Phase I ESA, the primary soil type beneath the Site is mapped as Urban Land (Ninyo & Moore, 2019).

2.4 Subsurface Conditions

The following sections provide a generalized description of the subsurface conditions encountered during this 2021 investigation.

Fill in the northern portion of the Site was encountered in all 75 borings to 2.5 feet below ground surface (bgs). The fill consisted of two distinct layers; 1) From below asphalt to 1-foot bgs consisted of gravel, silt, with pockets of sand and traces of wood, glass, and brick fragments: 2) from 1 foot to 2.5 feet bgs consisted of gravel, fine sand and silt (Figure 2 and Appendix A). Soil below two feet at borings SG3 and SG4 along the north

perimeter consisted of silty sand from 0.5-feet to 10-feet bgs. In the southern portion of the site, soil consisted of silty sand with clay to approximately 4.5-feet bgs and clayey sand with silt to 10 and 15 feet in borings SG2 and SG1, respectively.

According to Consolidated Engineering Laboratories' 2019 geotechnical investigation, soil consist of Merritt sands, consisting of dark brown sand to silty sand layers with frequent lenses of medium dense to very dense, clayey to silty sand to a depth of about 27 feet, below which primarily clean, fine sand is encountered to a depth of about 50 feet.

2.5 Site Hydrology

The following sections discuss the Site hydrology in terms of both surface waters and groundwater:

2.5.1 Surface Waters

There are no surface waters, including ponds, streams, creeks, lagoons, and other naturally-occurring bodies of water at the Site. The nearest water body in the San Francisco Bay approximately 4,600 feet to the south of the Site.

2.5.2 Groundwater

During implementation of the PEA Work Plan, groundwater was not observed in any of the borings which were advanced to a depth of up to 15 feet bgs. According to the State Water Resources Control Board's GeoTracker website (GeoTracker), groundwater information reported in a Second Half 2018 groundwater monitoring report for the former Shell-branded service station located at 1230 14th Street (approximately 750 feet northeast of the Site), the groundwater flow in the Site vicinity was reported to be towards the northeast and the depth to groundwater was reported to be approximately 11 to 13 feet bgs. Groundwater depths and flow directions can vary due to seasonal variations, groundwater withdrawal or injection, tidal influences, and other factors.

During a geotechnical investigation performed for the Site in November 2019, free groundwater was reportedly encountered at a depth of 18 to 19 feet bgs (CEL, 2019).

3 BACKGROUND

3.1 Site Status/Historical Site Information

The Site was developed in the late 1870s with the Cole Grammar School on the southern portion of the Site and several residential houses on the northern portion of the Site. During the 1920s the original school building was burned down and the residential houses were demolished and were replaced with a two-story elementary school building, a cafeteria building, five temporary classrooms, and a parking lot. In the 1950s several temporary classrooms were added and removed. In the late 1960s a Kindergarten building was constructed on the eastern portion of the Site. In the early 1970s the Kindergarten building was removed and replaced with five portable buildings, which were later removed in the late 1970s. In the early 2010s the eastern portion of the parking lot on the Site was fenced-off and used as the restricted parking of the Oakland School Police Department, and a storage building was constructed in the northeastern corner of the Site.

3.2 Current Use(s) of Surrounding Properties

The north-adjacent properties (located across 12th Street) include the California Cereal Products/Nabisco Brands Inc. property and a playground. The south-adjacent properties (located across 10th Street) include the Oakland Housing Authority and several row houses. The west-adjacent properties (located across Poplar Street) include several row houses. The east-adjacent properties (located across Union Street) are residences.

3.3 Records Review Information

A records review was completed in conjunction with the 2019 Phase I ESA (Ninyo & Moore, 2019).

3.4 Site Reconnaissance

A Site reconnaissance was completed as part of the Phase I ESA field assessment activities.

3.5 Interviews

Interviews were completed in conjunction with the Phase I ESA.

4 APPARENT PROBLEM

As identified in the PEA Work Plan Constituents of potential concern (COPC) in soil and soil gas at the Cole Central Administration Site include metals, TPHs, OCPs, PCBs, SVOCs, VOCs, PAHs, and dioxins/furans. The COPCs may be from the current structures, former structures, fill material, natural occurring constituents, or former burned structures.

5 ENVIRONMENTAL SETTING

5.1 Conceptual Site Model

Based on Phase I ESA and the scoping meeting with the DTSC, Ninyo & Moore created a summary of the Areas of Concern (AOCs) with regard to potential soil and soil gas impacts. The AOC are presented in Figure 2 and summarized in Table 1 below. The PEA assessment results are summarized in Section 6.

Table 1 – Areas of Concern

Areas of Concern	Period of operation	Sample Media	Sample Depths (feet bgs)	Potential Environmental Concern
AOC1–Elementary School Building (current building)	1936 to present	soil	Surface and 2	lead, arsenic, OCPs, and PCBs
AOC2- Cafeteria Building (current building)	1949 to present	soil	Surface and 2	lead, arsenic, OCPs, and PCBs
AOC3-Former Buildings (northern portion of the Site)	1902 to 1950s	soil	Surface and 2	lead, arsenic, OCPs, PCBs, and CAM 17 metals.
AOC4-Former Heating Oil UST	Removed in 1998. Installation date is unknown	Soil and soil gas	Soil -5,10, and 15 Soil gas-5 and 10	soil - TPHd/mo, TPHg, VOCs, metals soil gas - VOCs
AOC5-Waste Incinerator (currently on-Site)	1936 to unknown (no longer operational)	soil	Surface, 2 and 5	SVOC, metals, and dioxins/furans
AOC6-Hydraulic Elevator (currently on-Site)	unknown	soil	5 and 10	TPHd/mo and PCBs
AOC7–Pad Mounted Transformer (if contained PCBs)[1] (currently on-Site)	unknown	soil	Surface and 2	PCBs
AOC8-Burned Structures	1923	soil	Surface and 2	dioxins/furans

5.2 Factors Related to Soil Pathways

The Site is a former school currently used as offices for district employees. The Site is situated at an elevation of 20 feet above mean sea level. The topography of the Site generally slopes towards the northwest. The Site surface completion includes asphalt, concrete, and buildings on concrete slab as summarized in the above table.

6 SAMPLING ACTIVITIES

6.1 Pre-Field Activities

Ninyo & Moore conducted the following pre-field activities prior to conducting the field investigation.

6.1.1 Utility Locating

Ninyo & Moore marked the vicinity of proposed boring locations with white paint and/or stakes and notified Underground Service Alert (USA) at least 72 hours prior to the start of subsurface disturbance activities, as required by California law. USA notified utility companies of the planned activities and requested that they mark their subsurface utilities within the proposed boring locations by the proposed date. Prior to drilling, Ninyo & Moore contracted Ground Penetrating Radar Systems, LLC (GPRS), a private utility company, of San Jose, California to verify the presence of the underground utilities and to identify any previously unmarked utilities.

6.1.2 Health and Safety Plan

Ninyo & Moore prepared a Site-specific health and safety plan (HASP) to protect Site workers and the general public from the potential hazards associated with hand augering and drilling, dust generated by sampling activities, and associated work being performed during field activities. The HASP included a map to the closest medical emergency facility. Ninyo & Moore reviewed the HASP with field personnel prior to the start of field work and field personnel signed the acknowledgement form attached to the HASP, indicating they understood and would abide by its provisions.

6.1.3 Permitting

Ninyo & Moore obtained a drilling permit from Alameda County Public Works Agency (ACPWA) for the two soil borings extending deeper than 5 feet bgs and for the permanent dual-nested soil vapor wells.

6.2 Sampling Methods and Procedures

6.2.1 Sample Identifications

Boring locations are identified referencing the AOC that they are targeting. Borings are identified with the letter 'S' and are followed by a unique number for each boring location. For example, a boring labeled 'AOC1-S1' is a boring advanced within AOC1. Boring locations that target more than one AOC will be identified referencing all relevant AOCs. For example, a boring labeled 'AOC1/AOC4-S1' is a boring advanced to assess the current on-Site building (AOC1) as well as the former UST (AOC4).

Boring locations for AOC3 – Former Buildings are identified by a grid pattern. Borings are identified with the letter 'S' followed by a column number and row letter. For example, a boring labeled 'AOC3-S1A' is a boring advanced within AOC3 in column 1 row A.

Soil sample identifications consist of the boring identification followed by the depth of the sample collected. For example, the sample 'AOC1-SG1-5 indicates a soil gas sample collected from boring AOC1 from soil gas probe SG1 at 5 feet bgs.

Duplicate samples are identified by adding DUP at the end of the sample ID. For example, the duplicate for sample 'AOC1-S1-0.5' will be 'AOC1-S1-0.5 DUP'. Equipment blanks are identified by 'EB' followed by the date. For example, the equipment blank 'EB01012021' indicates an equipment blank collected on January 1, 2021. Trip blanks are identified by 'TB' followed by the date. For example, the trip blank 'TB01012021' indicates an equipment blank collected on January 1, 2021.

6.2.2 Soil Gas Probe Installation

In order to evaluate subsurface Site conditions, Ninyo and Moore advanced duel-nested soil gas probes at four locations (SG1 through SG4). Each of the locations included a nested probe at depths of 5 and 10 feet bgs.

Soil gas probes were installed using a hand auger and direct push (DP) drilling rig equipped with 2.75-inch diameter drill casing. Prior to drilling, the borings were cleared by hand auger to at least 5 ft bgs. Each soil gas probe consisted of a soil vapor sampling probe tip, constructed of either a stainless-steel screen or ceramic air-stone, connected to 0.25-inch Teflon or Teflon lined tubing. The boring was advanced using a direct push drill rig at least six inches deeper than the intended probe depths and filled with sand up to the depth of the probes. The probe was lowered into the boring and sand was added to a depth of six inches above the probe. The sand pack was topped with a transition seal of 6-inches of dry

bentonite followed by hydrated bentonite up to the bottom of the next sand interval for the shallow probe or up to ground surface. A tremie pipe was used to avoid bridging or segregation during the placement of the sand pack and annular seal at depths greater than five feet. The bentonite was hydrated in the annulus of the boring to further prevent bridging.

6.2.3 Soil Vapor Probe Sampling

On November 15 and 16, 2021, Ninyo & Moore collected soil vapor samples from soil gas probes (SG1 through SG4). One duplicate sample was collected from soil gas probe SG1-5. During the November sampling, water was observed in the sampling tubing while purging the 5-foot sample at location AOC9-SG2 and a vacuum was not established while purging the 10-foot sample at location AOC9-SG3. Ninyo & Moore attempted to sample AOC9-SG2 and ACO9-SG3 a second time on December 3, 2021. Ninyo & Moore was unable to collect the samples because of the same issues as the November sampling event.

The soil vapor probes were allowed to stabilize for a period of at least 72 hours before samples were collected in 1-liter batch certified Summa canisters. Soil gas samples were collected in accordance with the procedures described in DTSC's "Advisory: Active Soil Gas Investigations," dated July 2015 (DTSC 2015), including procedures for collecting samples in low flow, high vacuum conditions. In addition, an ambient air sample (OA-1) was collected at an up-gradient location during soil gas sample collection.

Prior to sample collection, a shut-in test was conducted on each sample train, consisting of the sample canister and sampling manifold (including an in-line filter and flow regulator) as a leak check to ensure the sampling assembly is free from leaks before purging and sampling. Each manifold and canister were placed under a minimum vacuum of 10 inches of mercury and sealed. Before use, each canister/manifold set was observed to ensure that the vacuum was retained for a minimum of five minutes prior to use. If there was any observable loss of vacuum, the fittings were adjusted until the vacuum in the sample train was retained indicating the absence of leaks.

Each probe was purged of three well volumes of vapor prior to sampling. The well volume was calculated using the internal volume of the tubing and manifold, the void space of the sand pack around the probe tip, and the void space of dry bentonite in the annular space. Purging was conducted using a separate 6-liter Summa canister. A flow rate of approximately 100 to 200 milliliters per minute and a vacuum of no more than 100 inches of

water was maintained during purging. During purging of probe SG2-5, water was observed being drawn into the sampling apparatus from the soil vapor probe. Groundwater had not been observed in this soil boring during installation of the probe, and groundwater was not observed in any of the other soil borings at similar depths (approximately 5.5 feet bgs) during our sampling activities. Additionally, during purging of probe SG3-10, the gauge reading on the purge canister and the gauge reading on the soil gas manifold equilibrated at an approximate reading of 5 inches of mercury and the purge canister was no longer pulling gas from the probe. As a result, no samples were collected from probes SG2-5 and SG3-10.

Following the shut-in test and well purging, samples were collected in the Summa canisters within a fully encapsulating shroud using helium as the leak detection compound. The atmosphere within the shroud was enriched to, and maintained at, a minimum of 20 percent helium during sampling. A flow rate of approximately 150 milliliters per minute was maintained by the laboratory-provided flow controller. Each canister was filled until a vacuum of approximately five inches of mercury remained in the sample canister.

For each sample canister, the sample ID, well purge volume, canister number manifold number, initial and final vacuum readings, sample collection time, shroud helium concentrations, and location were documented on field forms. Samples were properly labeled and transported under strict COC procedures to Eurofins TestAmerica of Sacramento, California, a California-certified analytical laboratory, for analysis.

6.2.4 Soil Sampling Procedures

Ninyo & Moore collected soil samples using hand-sampling equipment (a hand auger) or a direct push sampling rig. Where a hand auger was used, samples were collected from the auger tool and soil placed directly into laboratory-supplied, pre-cleaned glass jars and labeled properly. The hand auger was decontaminated between each sampling location.

Where a direct-push sampling rig was used, 1.5-inch-diameter acetate sample tubes were advanced beneath the subsurface inside a stainless-steel sample probe using hydraulic rams. Soil samples were collected from the desired interval at each boring location and placed into laboratory-supplied, pre-cleaned glass jars or stainless-steel liners and labeled properly. Each soil boring was abandoned using a Portland types I to IV cement and concrete, applied from the bottom of the borehole to the surface.

After labeling, the soil samples were logged onto chain-of-custody (COC) forms, sealed in plastic bags and placed in an ice-chilled cooler for transportation to the laboratory under proper chain-of-custody protocols.

Each boring location was located using a handheld Trimble R1 global positioning system unit (or similar device) during field activities. The unit is capable of providing an accuracy of less than one meter in the field.

7 SAMPLING RATIONAL

Soil and soil-gas samples were collected from borings across the Site within areas identified as AOC. Ranges of concentrations that exceeded their respective DTSC screening levels (SL) are summarized below by AOC and media. Soil-gas samples were collected from dual-nested soil vapor wells installed at a depth of 5 and 10 feet bgs. Any deviations from the Work Plan are discussed under each AOC below.

A sample matrix presenting AOC sample IDs, sample depths, analysis for soil and soil gas is presented in Table 2. Soil results are included in Tables 3 through 6 and soil-gas results are presented in Table 7. Duplicate sample results are included for each media in their respective table. Lab reports and data validation reports are included in Appendices B and C, respectively. Soil exceedances are presented on Figures 3 through 5.

8 SAMPLING RESULTS

8.1 AOC1 – Elementary School Building (current building)

Eleven borings (S1 through S11) were advanced adjacent to the Former Elementary School Building located in the southern portion of the Site to assess AOC1. Soil samples were collected from all 11 borings at depths of 0.0 to 0.5 feet below ground surface (bgs) and 2.0 to 2.5 feet bgs. Both sample depths were analyzed for OCPs; shallow soil samples were analyzed for arsenic, lead and PCBs. If the shallow result exceeded ESLs or SLs then the 2-foot sample was analyzed for the same constituent. Some of these borings were also part of other overlapping AOC assessments. Boring S7 was collected near both the waste incinerator and adjacent to the Elementary School Building but soil samples were not labeled with AOC1 in addition to AOC5. The samples form boring S7 were analyzed for overlapping constituents from AOC1 and AOC5. The sample locations are shown on Figures 3 through 5.

Constituent	Exceedance - (Quantity of Samples Exceeding SLs) and Range of Detections Exceeding SLs
Soil (mg/Kg)	
Lead	(8) 140 – 730

8.2 AOC2 – Cafeteria Building (current building)

Five borings (S5 and S12 through S14) were advanced adjacent to the cafeteria building located on the western boundary of the Site to assess potential impacts from building construction materials and application of pesticides. Soil samples were collected from all five borings at depths of 0.0 to 0.5 feet below ground surface (bgs) and 2.0 to 2.5 feet bgs. Both sample depths were analyzed for OCPs; shallow soil samples were analyzed for arsenic, lead and PCBs. Some of these borings were also part of other overlapping AOC assessments. The sample locations are shown on Figure 2.

Constituent	Exceedance - (Quantity of Samples Exceeding SLs) and Range of Detections Exceeding SLs
Soil (mg/Kg)	
Arsenic	(1) 18

8.3 AOC3 – Former Buildings

A total of 75 borings were advanced within the footprint of the former buildings to assess potential impacts to soil from building construction materials, application of pesticides, and fill material from unknown sources. The sample locations were based on a grid overlain onto the area of the former buildings. Soil samples were collected from all 75 borings at depths of 0.0 to 0.5 feet below ground surface (bgs) and 2.0 to 2.5 feet bgs. Both sample depths were analyzed for OCPs; shallow soil samples were analyzed for arsenic, lead and PCBs with one of every fourth sample location analyzed for full CAM-17 metals. Some of these borings were also part of other overlapping AOC assessments. The approximate location of the former buildings and sample locations are shown on Figure 3.

Constituent	Exceedance - (Quantity of Samples Exceeding SLs) and Range of Detections Exceeding SLs
Soil (mg/Kg)	
Arsenic	(12) 11 – 45
Lead	(60) 80 – 990

8.4 AOC4 – Former Heating Oil UST

One soil boring (S1) was advanced to a depth of 15 feet bgs adjacent to the location of the Former Heating Oil UST on the southern boundary of the Site to assess potential impacts of the former UST. Soil samples were collected at a depth of 5, 10 and 15 feet bgs. In addition, a dual nested soil gas probe was installed in the same boring in accordance with Section 6.2.2. Soil samples were analyzed for TPHd, TPHmo, TPHg, VOCs and metals. Soil gas samples were

analyzed for VOCs and helium (tracer gas compound). Helium was detected in the soil gas sample at 10 feet bgs (SG-1-10) at 18%. A second sample was collected with helium below 1%. The sample location is shown on Figure 2.

Constituent	Exceedance - (Quantity of Samples Exceeding SLs) and Range of Detections Exceeding SLs	
Soil Gas (µg/m^3)		
	Shallow (5 feet)	Deep (10 feet)
Chloroform	(1) 15	(1) 6.9

8.5 AOC5 – Waste Incinerator

One soil boring (S7) was advanced adjacent to the waste incinerator located in the basement near the Elementary School Building. The boring was advanced to a depth of 5 feet and samples were collected at a depth of 0.5, 2, and 5 feet bgs and analyzed for SVOCs, CAM 17 Metals, and dioxins/furans. The toxic equivalency value (TEQ) for dioxins/furans was calculated to be 0.156 picograms per gram (pg/g) in the 0.5-foot sample and 1.4 pg/g in the 2-foot sample. The sample location is shown on Figure 3. No exceedances were detected in the three samples collected near the waste incinerator.

8.6 AOC6 – Hydraulic Elevator

Three borings (S9A, S9B, and S9C) were advanced adjacent to the elevator located along the northeast end of the Elementary School Building. During field activities, refusal was encountered in the boreholes which appeared to consist of a concrete pad at a depth of approximately 4.0 to 4.5 feet bgs. A soil sample was collected from a depth of 4 feet bgs from boring S9B and analyzed for TPHd/mo and PCBs. In addition, PCBs were analyzed from boring S9A as part of the AOC1 assessment. During sampling activities Ninyo & Moore visually inspected the elevator shaft and did not find evidence of hydraulic fuel leaks. No exceedances for TPHd/mo and PCBs were detected in the samples collected from S9A and S9B.

8.7 AOC7 – Pad-Mounted Transformer

One boring (S8) was advanced adjacent to the pad-mounted transformer located in the northeast area of the Elementary School Building in order to assess potential PCB impacts to soils. Soil samples were collected at 0.0 to 0.5 and 2.0 to 2.5 feet bgs and analyzed for PCBs. The sample location is shown on Figure 3. During sampling activities, the area around the transformer was visually inspected and no evidence of oil staining or leaks were observed. No exceedances were detected in soil samples collected from boring S8.

8.8 AOC8 – Burned Structures

The location of the burned buildings is unknown and samples were collected throughout the Site. Dioxins/furans were analyzed in three soil borings (S4, S7 and S10) around current buildings and in nine borings (S1A, S5B, S8C, S2D, S6E, S1E, S3G, S6H and S9I) advanced within the grid as part of AOC3. Samples from boring S2 were not analyzed for dioxin/furans as stated in the Work Plan due to a lab error. Soil samples were collected at 0.0 to 0.5 and 2.0 to 2.5 feet bgs. Ash material was encountered in boring S9A and S9B advanced as part of the AOC1 and AOC6 assessment. Samples AOC1-S9A and AOC6-S9B were additionally analyzed for dioxins/furans in order to evaluate the impact of the ash burned material and no dioxins/furans were detected above the laboratory reporting. The only dioxin with a SL is 2,3,7,8-TCDD and no sample was found above the SL of 4.8 pg/g. The highest concentrations of dioxins/furans (TEQ of 9.6) was detected in the 0.5-foot sample in boring S4 (AOC1/AOC8-S4-0.5) on the west side of the current two-story building. All other TEQ calculations were below 4.8 pg/g. The sample locations are shown on Figure 3.

8.9 AOC9 – Northern and Southern Boundaries

To assess potential impacts from off-Site properties to the north and south of the Site and for general up-gradient/background soil and soil gas assessment, soil and soil gas samples were collected along the northern (SG3 and SG4) and southern (SG2/S2) boundaries. Borings were advanced to a depth of 10.5 feet bgs and soil samples were collected from 5 and 10 feet bgs. In addition, dual nested soil gas probes were installed in the same boring in accordance with Section 5.2.2. Ninyo & Moore attempted to collect soil gas samples at the 5-foot probe in SG2 and 10-foot probe in SG-3 during two separate Site visits on November 15 and December 3. Water was observed in the sampling tubing of SG2 while purging during both sampling attempts and a sample was not collected. Both sampling attempts were well after or before rain events. Irrigation lines were observed in the vicinity but no irrigation water was observed in the area. The 10-foot sample at SG3 was not collected due to low permeability soils inhibiting soil gas flow.

Soil samples were analyzed for TPHd, TPHmo, TPHg, VOCs, and CAM 17 Metals. Soil gas samples were analyzed for VOCs, fixed gases (oxygen, carbon dioxide and methane) and helium (tracer gas compound). Some of these borings were also part of other overlapping AOC assessments. The sample locations are shown on Figure 3. No exceedances were detected in any of the soil samples collected from borings SG3, SG4, and SG2/S2. The only exceedance is soil gas samples was chloroform in SG2-10 at a concentration of 19 µg/m3.

8.10 AOC10 – Railroad Lines

To assess potential impacts from the railroad tracks adjacent to the northeast corner of the Site, soil samples were collected from the northeast borings (S8A, S8B and S9C) within the grid sampling advanced as part of AOC3. Soil samples were collected at 0.0 to 0.5 and 2.0 to 2.5 feet bgs. Soil samples were analyzed for CAM 17 metals, SVOCs, and PAHs. Only exceedances of lead were detected in S8A, S8B and S9C and are discussed in Section 8.3. SVOCs and PAHs were not detected above the laboratory reporting limits. The sample locations are shown on Figure 3.

9 STATISTICAL ANALYSES OF SOIL ARSENIC DATA

The statistical methods used in the data evaluation were taken directly from DTSC's policy for selecting COPCs at hazardous waste sites and permitted facilities (https://dtsc.ca.gov/assessing-risk/). The first objective of the statistical analysis is to determine if the soil arsenic data are likely to be drawn from the same population (i.e., all samples collected from a non-contaminated site). For this type of analysis, the DTSC recommends to "construct a table showing for each metal the frequency of detection, range of detected values, range of sample quantitation limits, arithmetic means, and standard deviations, and coefficients of variation. Typically, data drawn from just one population will display a range of detected values of no more than 2 orders of magnitude and a coefficient of variation of no greater than 1. When either of these conditions is not met, one must suspect that values representative of contamination have been included in the population." (DTSC 1997, Section 4.3, page 4). The table recommended by the DTSC is presented below.

Statistical Parameter	Arsenic
Number of Samples	124
Number of Non-Detected	19
Detection Frequency	85 %
Minimum detected value	1.9 mg/kg
Maximum detected value	45 mg/kg
Mean concentration	5.43 mg/kg
First quartile (Q1)	2.70 mg/kg
Median	4.00 mg/kg
Third quartile (Q3)	7.30 mg/kg
Standard deviation	5.12
Coefficient of variation	0.94
Order or magnitude difference between minimum and maximum value	1.68

For purposes of determining background concentrations, all soil arsenic data collected (regardless of depth) were included in the evaluation. In accordance with DTSC (1997) guidance, non-detected values were included in the evaluation as one-half the reported detection limit.

The next step in the analysis of soil metal data is the definition of the "Upper Bound Background Concentration." The Upper Background metal concentration was obtained using a "Fourth Spread" analysis as recommended by DTSC (2009). The Fourth Spread (Fs) of the soil metal data was obtained using the following formula:

$$Fs = (Q3 - Q1)$$

Where:

Fs	=	Fourth spread (mg/kg)
Q3	=	Third quartile (mg/kg)
Q1	=	First quartile (mg/kg)

The estimated Fs for the soil arsenic data is 4.60 mg/kg.

Outliers for the upper bound of the Site-specific soil arsenic concentration are defined as:

All data points greater than Q3 + [1.5 x Fs]

or

7.30 mg/kg + [1.5 x 4.60 mg/kg] = 14.20 mg/kg

According to these calculations, any soil arsenic concentration higher than 14.20 mg/kg are considered to be outliers. The samples containing arsenic at concentrations higher than 14.20 mg/kg were:

Sample ID	Arsenic Concentration (mg/kg)
AOC-S3C-0.5	15
AOC3-S2G-0.5	16
AOC3-S3E-0.5	16
AOC2/AOC3-S13/S3I-0.5	18
AOC3-S5G-0.5	45

In an effort to evaluate whether metal concentrations in soils are, in fact, derived from more than one distinct population, outliers were also labeled by constructing a cumulative probability plot. The plot was constructed by plotting the cumulative probability vs. soil arsenic concentration. Non-detected values were assigned a value equal to one-half the reported detectable concentration (DTSC, 1997).

According to the DTSC (1997) guidance, inflections or breaks in the cumulative plot line generally indicate the potential presence of soil metal contamination. Probability plot for arsenic detected in soil at the Site is presented in Figure 7. As can be seen in the figure, there are breaks in the line at arsenic concentrations of about 12 and 15 mg/kg. The observed breaks correlate well with the estimated, Site-specific upper background concentrations.

Now that the presence and concentration of outliers has been labeled, a statistically derived background soil arsenic concentration can be calculated by estimating the 95 percent upper confidence limit of the 99th quartile of the data set (DTSC 2009). For this exercise, all outlier values were removed, and only soil data considered to be representative of ambient, background concentrations were included.

The upper limit of the data set can be estimated according to the following equation (DTSC 2009):

$$UL_{1-\alpha}\ (x_p) = x + sK_{1-\alpha,\ p}$$

Where,

$UL_{1-\alpha}\ (x_p)$	=	The upper limit of the data set
x	=	Mean of the data set
s	=	Standard deviation of the mean
$K_{1-\alpha,\ p}$	=	Statistical tolerance factor for estimating and upper 100(1-α) confidence limit on the pth quartile (2.649, from Table A3, Gilbert 1987).

The statistical parameters obtained for the data once the outliers were removed and the estimated 95 percent upper confidence limit of the 99th quartile concentrations are presented below.

Statistical Parameter	Arsenic
Number of Samples	119
Minimum detected value	1.9 mg/kg
Maximum detected value	14.00 mg/kg
Mean concentration	4.73 mg/Kg
Standard deviation	3.10
95 Percent Upper Confidence Limit of the 99th Quartile	12.93 mg/kg

Based on this analysis, it is recommended confirmation samples be compared to the 95 percent upper confidence limit of the 99th quartile concentration of 12.93 mg/kg.

10 HUMAN HEALTH SCREENING EVALUATION

The PEA screening evaluation for human health effects involves identifying chemicals of potential concern (COPCs), evaluating exposure pathways and media of concern, assessing chemical toxicity, and then characterizing risk. Estimated health risks are based on a calculated dose, which integrates exposure parameters for the receptors of concern with chemical specific toxicity criteria. The calculated risks are then compared to health-based guidelines developed by the EPA and DTSC. For the purpose of the PEA screening evaluation, the potential dose is calculated for a resident (adult and child) occupying the Site.

Exposure to COPCs can only occur if there is a complete pathway by which the COPCs in soil, water, or air can be contacted by humans. Therefore, the evaluation of exposure pathways is the first step in the human health screening evaluation. Potential health hazards and risk are then calculated based on an evaluation of potential exposure concentrations and the toxicity of the COPCs. The findings of the human health screening evaluation are summarized in the risk characterization summary.

10.1 Exposure Pathways and Media of Concern

For the purpose of this PEA it is assumed that hypothetical residents at the Site may be exposed to Site chemicals through incidental ingestion, dermal contact, inhalation of soil particulates containing COPCs, and inhalation of soil vapor containing COPCs. In accordance with PEA guidelines, exposures to COPCs were evaluated assuming hypothetical residential exposure. Figure 6 presents the Conceptual Site Model (CSM) that links soil COPCs with hypothetical receptors at the Site.

10.1.1 Soil Exposure Pathways

COPCs discovered at the Site include metals, trace 4,4'-DDE, anthracene, phenanthrene, DRO, and MRO. These chemicals were detected in surficial- and subsurface soil; therefore, the potential exists for exposure to humans by dermal contact and incidental soil ingestion. All organic chemicals detected in soil were retained as COPCs in this risk evaluation.

In a conventional risk assessment, metal elements detected in soil at concentrations deemed to be within natural, background concentrations are excluded from the risk evaluation (USEPA, 1989 and DTSC, 2015). For this evaluation, the background metal data set was obtained from soil metal data collected from California Air Force facilities (Hunter, Davis, and Roach, 2004). Maximum detected soil metal concentrations were compared to the 95th percentile concentration obtained from the Air Force facilities. The comparison to background concentrations is presented in Table 8. In addition, maximum

detected soil metal concentrations were compared to soil screening levels. In an effort to be conservative, screening levels selected were taken from published soil screening levels deemed to be protective of residential receptors. Any metal detected in soil at concentrations higher than either the background concentration or the established screening levels for residential land use were retained in this HHRA as COPCs. Only arsenic and lead detected in soil at the Site exceeded both, their background concentration or their screening value. Therefore, only the metals arsenic and lead were selected as COPCs in this HHRA. The selection of metal COPCs is presented in Table 8.

10.1.2 Water Exposure Pathways

Groundwater was not encountered during the PEA. On-Site receptors will receive their drinking water from municipal water suppliers and would not depend on on-Site groundwater wells for their water needs. Therefore, the groundwater exposure pathway is not considered to be a complete exposure pathway. In addition, permanent surface water bodies do not occur on, or near the Site, therefore, surface water is not expected to be a consideration.

10.1.3 Air Exposure Pathways

The following sections discuss the air exposure pathways.

Fugitive Dust Inhalation

Metals, dioxins/furans, a few pesticides and DRO, and MRO were detected in soil at the Site (see Tables 3 through 6). Exposure to these chemicals may occur via inhalation of contaminated fugitive dust. Inhalation exposure to non-volatile compounds is typically minor in fugitive dust when compared to direct ingestion exposure (DTSC, 2015b). Nevertheless, a relationship must be estimated between the chemical concentration in soil and the concentration in air due to fugitive dust emissions from surface soil.

The EPA (2002) and DTSC (2015b) recommend using a particulate emission factor (PEF) to model COPC concentrations in airborne dust. The PEF represents an annual average emission rate based on wind erosion. Default PEF values for residential exposure scenarios published by the DTSC (2019a) were used in this risk evaluation. The residential PEF value of 1.316E+09 cubic meters per kilogram (m^3/kg) was used to estimate dust emissions for the recreational receptors. The ambient chemical air concentration due to dust emissions was obtained by dividing the soil chemical concentrations by the PEF. The estimated ambient air exposure point concentrations were used to estimate dust inhalation exposures for on-Site receptors.

Indoor Vapor Inhalation

Screening-level models were used to predict indoor air concentrations that may result from the chemical vapors potentially released from soil vapor under the Site. The estimated vapor flux and indoor air concentrations were then used to estimate potential health risks that may result from on-Site exposures. For purposes of this evaluation, it was assumed the land use would be residential now and into the foreseeable future.

In this evaluation, maximum detected soil vapor chemical concentrations (Table 9) were considered representative of chemical concentrations present in soil vapor under the Site.

The DTSC guidance recommends that multiple lines of evidence be used when evaluating the potential risk and hazards posed by vapor intrusion. DTSC recommends that the indoor air chemical concentrations that can result from vapor intrusion be estimated using the following equation:

$$AF = \frac{C_{indoor}}{C_{soil\ vapor}}$$

Where:

AF	=	Attenuation factor (unitless)
C_{indoor}	=	Indoor air concentration (micrograms per cubic meter [µg/m^3])
$C_{soil\ vapor}$	=	Soil vapor concentration (µg/m^3)

Using the above equation, the indoor air chemical concentration can be estimated by multiplying the known soil vapor concentration by the default attenuation factor (AF).

In accordance with DTSC (2020a) guidance, the default AF of 0.03 was used in the evaluation for chemicals detected in soil vapor at a depth of 5 and 10 feet bgs. Estimated indoor air chemical concentrations that might result from vapor intrusion are presented in Table 9.

10.1.4 Summary of Selected Exposure Pathways

For the purpose of this PEA screening evaluation, the hypothetical resident was assumed to be exposed to COPCs through direct dermal contact, incidental ingestion, and inhalation of volatiles and airborne particulates. Exposure to groundwater and surface water is deemed to be an incomplete pathway; therefore, is not a consideration. Exposure parameters used to characterize hypothetical on-Site residential receptors are presented in Table 10.

10.2 Exposure Concentrations and Chemicals

Tables 3 through 7 present the chemicals detected in soil at the Site. In accordance with the DTSC (2015) guidance, the maximum detected COPC concentrations were evaluated as potential exposure point concentrations (EPCs). These EPCs were used in the risk calculations. Soil data collected from surface and subsurface soils were combined in the evaluation of risks. That is, all soil samples collected at the Site were included in the calculation of risks regardless of the depth where the samples were collected. An assumption was made that an individual may come in contact with the entire soil profile if the Site was re-graded.

10.3 Toxicity Values

The toxicity assessment characterizes the relationship between the magnitude of exposure to a COPC and the nature and magnitude of adverse health effects that may result from such exposure. For the purposes of calculating exposure criteria to be used in risk assessments, adverse health effects are classified into two broad categories, carcinogens and non-carcinogens. Toxicity values/exposure criteria are generally developed based on the threshold approach for non-carcinogenic effects and the non-threshold approach for carcinogenic effects. Toxicity values may be based on epidemiological studies, short-term human studies, and sub-chronic or chronic animal data.

In this assessment, chronic toxicity criteria were selected in accordance with the DTSC's "Toxicity Criteria for Human Health Risk Assessment" (effective September 2018) (https://dtsc.ca.gov/LawsRegsPolicies/Regs/Toxicity-Criteria-for-Human-Health-Risk-Assessment). Toxicity information was obtained from the DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 10, Toxicity Criteria (DTSC, 2019b).

10.3.1 Carcinogenic Effects

Certain chemicals are regulated as carcinogens based on the likelihood that exposure may cause cancer in humans. Numerical estimates of cancer potency for these chemicals are presented as cancer slope factors (CSFs). The CSF defines the cancer risk due to constant lifetime exposure to one unit of a carcinogen (units of risk per mg/kg-day). CSFs are derived by calculating the 95% UCL on the slope of the linearized portion of the dose-response curve using the multistage cancer model on the study data. Use of the 95%UCL of the slope means that there is only a 5% chance that the probability of a response could be greater than the estimated value for the experimental data used. This is a conservative approach and may overestimate the actual risk given that the actual risk is expected to be between zero and the calculated value. Carcinogenic slope factors assume no threshold for effect, i.e., all exposures to a chemical are assumed to be associated with some risk.

For inhalation exposures cancer slope factors are expressed as inhalation unit risk (IUR) for a chemical. The IUR, which is expressed in units of inverse micrograms per cubic meter $(ug/m^3)^{-1}$, is the 95% UCL of the probability of carcinogenic response per unit daily exposure to a given chemical concentration over a lifetime. The IUR multiplied by the lifetime exposure concentration of the chemical provides an estimate of the 95% UCL of the theoretical cancer risk for the specific chemical. Cancer slope factors and IUR used in this evaluation are summarized in Table 11.

10.3.2 Noncarcinogenic Effects

For the purpose of assessing risk associated with non-carcinogenic effects, the EPA has adopted a science policy position that protective mechanisms such as repair, detoxification, and compensation must be overcome before an adverse health effect is manifested. Therefore, a range of exposures exists from zero to some finite value (a threshold) that can be tolerated by the organism without appreciable risk of adverse effects occurring.

Noncarcinogenic effects were evaluated using reference doses (RfDs) developed by the EPA. The RfD is a health-based criterion based on the assumption that thresholds exist for noncarcinogenic toxic effects. In general, the RfD is an estimate (with uncertainty) of a daily exposure to the human population that is likely to be without appreciable risk of chronic effects during a lifetime of exposure. RfDs are expressed as acceptable daily doses in milligrams of compound per kilogram of body weight per day (mg/kg-day). Most RfDs are based on oral exposure data.

A reference concentration (RfC) is an exposure concentration in air that is not expected to cause adverse health effects over a lifetime of daily exposure in the most sensitive population. RfD and RfC used in this evaluation are summarized in Table 11.

10.3.3 Health Risk Evaluation for Lead Exposure

The carcinogenic and non-carcinogenic toxicity criteria described above do not apply to inorganic lead. RfD, RfC, IUR and CSF are not applicable because of incomplete knowledge of the complex physiological dynamics of lead in the body (DTSC, 2020). Alternative methods have been developed to evaluate potential health risks from exposures to inorganic lead. These methods are based on establishing a target blood-lead level that is not expected to result in toxicity. The target level approach is considered appropriate because lead toxicity effects are typically only observed above certain blood-lead levels.

10.4 Risk Characterization Summary

Risk characterization involves estimating the magnitude of the potential adverse health effects of the hazardous chemicals under study and making judgments about the nature of the health threat to the defined receptor populations. It combines the results of the dose-response (toxicity) and exposure assessment.

Excess cancer risks were estimated by multiplying the lifetime-average daily dose (LADD) by the chemical carcinogenic toxicity criteria. The equation used to estimate the excess cancer risk is:

$$Excess\ Cancer\ Risk\ =\ LADD\ x\ CSF$$

The excess cancer risks are then compared to the risk level considered acceptable by the DTSC (1E-06).

Hazard quotients were estimated by calculating the ratio of the average daily dose (ADD) to the corresponding chronic reference dose for noncarcinogenic effects. The equation used to estimate the hazard quotient is:

$$Hazard\ Quotient\ =\ \frac{ADD}{RfD}$$

The hazard quotients are then compared to an acceptable hazard level. Hazard quotients less than the benchmark hazard level of 1 indicate that no adverse health effects are predicted from exposure to COPCs at the Site.

The chemical-specific and pathway-specific cancer risks and hazard index estimated for soil COPCs are presented in Tables 12. Supporting calculations are presented in Appendix D. The chemical-specific and pathway-specific cancer risks and hazard index for VOCs detected in soil gas are summarized in Tables 13. Supporting calculations are presented in Appendix D.

Using maximum detected concentrations for COPCs detected in soil at the Site, the total incremental cancer risk for hypothetical residential exposure to Site-related chemicals was estimated to be 4E-06 (Table 12). The total cancer risk exceeds the acceptable cancer risk of 1E-06. The chemicals responsible for the exceedance were total dioxins as dioxin TEQ and, to a lesser extent, Dieldrin (Table 12).

Using the maximum VOC concentrations detected in soil vapor, the cancer risks estimated to result from vapor intrusion was 5E-06 (Table 13). This estimated cancer risk exceeds the acceptable cancer risk of 1E-06. The chemical responsible for the exceedance was chloroform.

is known to be formed from the reaction of chlorinated water with soil organic matter. Free chlorine can react with organic matter in soil to form chloroform and other trihalomethanes. Thus, it is highly likely that the chloroform detected in soil gas could have originated from chlorinated water in the subsurface. Using maximum detected soil chemical concentrations, the total hazard index for hypothetical residential exposure to COPCs in soil was estimated to be 0.2 (Table 13). The estimated hazard index is below the acceptable hazard index of 1.

Using the maximum VOC concentrations detected in soil vapor, the hazard index estimated to result from vapor intrusion was 0.03 (Table 13). The hazard index estimated to result from VOCs intrusion is lower than the acceptable hazard index of 1 (Table 13)

10.5 Lead Exposure Health Hazards

Given the unique toxicological and pharmacological properties of lead, the Hazard Quotient method is inappropriate for this chemical. For lead, the DTSC (2020) recommends comparing detected soil lead concentrations to published soil screening levels. For this evaluation, the soil screening levels published by the DTSC (2020) was used as the soil screening concentration. The soil lead screening level for residential exposure scenarios has been set at 80 mg/kg (DTSC, 2020). The 95-percent upper confidence limit (95UCL) of the arithmetic mean concentration for lead was estimated to be 181.3 mg/kg (Appendix E). This value exceeds the DTSC's screening level of 80 mg/kg, it is concluded that lead in soil could pose a health threat to hypothetical on-Site occupants.

10.6 Uncertainty Analysis

It is important to fully specify the assumptions and uncertainties inherent in the risk assessment for two reasons: (1) to place the risk estimates in proper perspective, and (2) to identify key Site-related variables and assumptions that contribute most to the conclusions reached in the risk assessment. The focus of this section is also to highlight parameters and Site conditions that contribute most to the predicted risks. The frequency and duration of soil contact activities would be a significant factor affecting the potential for adverse human health impacts from the Site.

This health risk evaluation was based on the application of conservative methods and assumptions in all phases of the assessment. Because EPCs were derived from maximum detected concentrations, conservative assumptions and methodology were necessarily employed to minimize the possibility of underestimating risks. This practice, although commonly used in the risk assessment process, necessarily introduces a significant level of conservatism in the conclusions derived from the assessment. Examples of some of the conservatism in this assessment include:

- It was assumed that future receptors at the Site would be exposed to chemicals in soil and dust 100 percent of the time while at the Site. In reality, receptors at the Site are not likely to be there for more than eight hours a day, five days a week.

- It was assumed that future occupants of the Site would have contact with soil. However, it is known that most, if not all, the Site surface area is and will be occupied by buildings, asphalt, or landscaped. Thus, future contact with soil will be minimal.

- Carcinogenic risks for all pathways were based on a residential exposure of 350 days per year for 26 years. A more realistic exposure scenario for a school Site would be to assume an exposure frequency of 250 days per year for a duration of 6 years, representing a typical school exposure scenario.

10.7 Human Health Screening Evaluation Conclusions

Based on the results of this investigation, Ninyo & Moore provides the following conclusions and recommendations:

- The upper limit arsenic background concentration for the Site was estimated to be 14.20 mg/kg. Only 5 of the 124 soil samples collected at the Site contained arsenic at concentrations higher than the estimated local background concentration. Therefore, the distribution of arsenic contamination at the Site appears to be limited and localized. The estimated 95% UCL for arsenic using all available data was estimated to be 7.52 mg/kg (Appendix E).

- Relatively high concentrations of lead were detected in soil at the Site. The estimated 95% UCL for lead was estimated to be 181.3 mg/kg (Appendix E). This value exceeds the DTSC (2020) soil screening value for lead of 80 mg/kg. Therefore, it is concluded lead in soil could pose a potential health hazard to future on-Site receptors.

- Using maximum detected concentrations for all organic chemicals detected in soil at the Site, the total incremental cancer risk for hypothetical residential exposure to Site-related chemicals was estimated to be 4E-06. This value exceeds the acceptable cancer risk of 1E-06. The “risk drivers” were found to be dioxins/furans and Dieldrin (Table 12).

- Using maximum VOC concentrations detected in soil gas, the total incremental cancer risk for hypothetical residential exposure to indoor air was estimated to be 5E-06. This value exceeds the acceptable cancer risk of 1E-06. The “risk driver” was found to be chloroform (Table 13). It should be noted that chloroform is known to be formed from the reaction of chlorinated water with soil organic matter. Free chlorine can react with organic matter in soil to form chloroform and other trihalomethanes. Thus, it is highly likely that the chloroform detected in soil gas could have originated from chlorinated potable irrigation water in the subsurface. Furthermore, chloroform was only found above the SL in soil gas samples collected on along southern perimeter of the site in a landscaped area where irrigation lines were observed.

- Using maximum detected soil chemical concentrations, the hazard indices estimated to result from soil exposure or indoor air exposure were estimated to be lower than 1 (Tables 13 and 14). Both estimated hazard indices were within levels considered acceptable to California health and environmental protection agencies.

11 ECOLOGICAL SCREENING EVALUATION

An ecological screening evaluation was not completed.

12 CONCLUSIONS AND RECOMMENDATIONS

Conclusions and recommendations are presented below.

12.1 Conclusions

AOCs 1 through 10 of the OUSD Cole Central Administration Center Project were assessed in October through December 2021. Lead, arsenic, and dioxin/furans impacts were identified in soil. Remaining data gaps identified are:

- Vertical delineation of lead concentrations that exceed SLs.
- Vertical and lateral delineation of dioxins/furans concentrations that exceed SLs.

12.2 Recommendations

- Evaluate mitigation and/or remediation options with respect to the proposed improvement plans (i.e., building locations, hardscape).
- Prepare a Site-Specific Health and Safety Plan and a Soil Management Plan for any work where contractors shall be working in or excavating soil.
- Delineate lead vertically in AOC 3. Grading is expected during development of the Administration building and soil will be removed and disposed of off-Site. Vertical delineation will determine the distribution of elevated lead concentrations in soil that may be excavated during grading.
- Delineate dioxin/furans in soil vertically and laterally near the boring S4 on the west side of the current two-story building (AOC 1).

13 LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in Site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past on-Site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject Site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed Site conditions. It should be understood that the conditions of a Site could change with time as a result of natural processes or the activities of man at the subject Site or nearby Sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

This report is intended exclusively for use by the Oakland Unified School District. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than those noted is undertaken at said parties' sole risk.

Notes:

-- - not analyzed

NE - not established

bgs – below ground surface

mg/Kg – milligrams per kilogram

DUP - duplicate sample

STLC - soluble threshold limit concentration

TCLP - toxicity characteristic leaching procedure

TTLC - total threshold limit concentration

N/A - Not Applicable

ND - not detected

ND<X – analyte not detected at or above laboratory reporting limit X

STLC x 10 - ten times the STLC regulatory limit

TCLP x 20 - 20 times the TCLP regulatory limit

Metals analyzed by Environmental Protection Agency (EPA) Method 6010B; mercury analyzed by EPA Method 7471A

a. Arsenic ESLs replaced with site-specific maximum background level from Duverge, 2011. Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region, Decembe

DTSC SL - Department of Toxic Substances Control Screening Levels, Human Health Risk (HERO), Note 3, Quarterly Update, April 2019 Residential Soil; if cancer endpoint value not available, noncancer endpoint value chosen--if no values, default to EPA Regional Screening Levels (RSL), TR=1E-06, HQ=1, November 20

Shaded gray indicates concentration exceeds ten times the STLC

Underlined value indicates concentration exceeds twenty times the TCLP

Bold - indicates concentration exceeds associated DTSC SL and/or EPA RSL

Screening Criteria									
DTSC SL			2,000	1,900	NE	34	NE	240	Various
EPA RSL					36,000		36,000		

Notes:

-- - not analyzed

NE - not established

bgs – below ground surface

µg/Kg – micrograms per kilogram

ND - not detected at or above the laboratory reporting limit

ND<X – analyte not detected at or above laboratory reporting limit X

OCPs - organochlorine pesticides, analyzed by Environmental Protection Agency (EPA) Method 8081

PCBs - polychlorinated biphenyls, analyzed by EPA Method 8082

PAHs - polycyclic aromatic hydrocarbons analyzed using EPA Method 8270C selective ion measurement (SIM)

SVOC - semivolatile organic compound, analyzed by EPA Method 8270C SIM

* = All other PCBs are not detected above the labratory reporting limit

DTSC SL - Department of Toxic Substances Control Screening Levels, Human Health Risk (HERO), Note 3, Quarterly Update, April 2019 Residential Soil; if cancer endpoint value not available, noncancer endpoint value chosen--if no values, default to EPA Regional Screening Levels, TR=1E-06, HQ=1, November 2018

Bold - indicates concentration exceeds associated DTSC SL and/or EPA RSL

Notes:

% - percent

µg/m³ = micrograms per meters cubed

bgs = below ground surface

ND = not detected (see laboratory report for reporting limit)

NA = not analyzed

NE = not established

-- = not analyzed, not applicable, or not available

ND<X = analyte not detected at or above laboratory reporting limit X

Fixed gasses analyzed by American Society for Testing Materials (ASTM) Method D 1946

VOCs - Volatile organic compounds, analyzed by Environmental Protection Agency (EPA) TO-15

1. DTSC SLs - Screening Levels for Residential Ambient Air (SLs calculated by Residential Cancer Endpoint Final Value divided by an attenuation factor of 0.001 [DTSC , 2011]), from the DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 3, June 2020. Note: if the SL is not listed in HERO HHRA Note 3, then the SL value is obtained from the United States Environmental Protection Agency Regional Screening Level, May 2021.

Bold - indicates concentration is at or exceeds residential and/or commercial ESL

Notes:

ND - not detected

mg/Kg – milligrams per kilogram

[1] - Maximum concentration from the 0 to 10 foot soil depth below ground surface.

[2] - 95th Percentile soil concentration. Taken from: Hunter, Davis and Roach (2005)

RSL - Regional Screening Level. From Regional Screening Level Table (RSL) Master (EPA, 2021)

Note 3 SLs - Cal-EPA 2020. Human Health Risk Assessment (HHRA) Note Number 3. DTSC-modified Screening Levels. June

na - Not Available

Bold+Shaded Indicates the concentrations which exceeded their respective residential soil screening level; therefore, these metals were selected as chemicals of potential concern (COPCs)

Table 9 – Indoor Air Exposure Point Concentrations

COPC	CAS Number	Maximum Detected Soil Gas Concentration (µg/m3)	Estimated Indoor Chemical Air Concentration (ug/m3)
2-Propanol	78,831.00	23	6.90E-01

Laboratory Reports – Soil Groundwater and Soil Gas

Ninyo & Moore
2020 Challenger Drive, Suite 103
Alameda, California 94501
Tel: 510-343-3000

RE: Cole Administration Building

Work Order No.: 2111198

Dear Nathan Diem:

Torrent Laboratory, Inc. received 5 sample(s) on November 17, 2021 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991 If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

Kathie Evans
Project Manager

December 02, 2021
Date

Date: 12/2/2021

Client: Ninyo & Moore

Project: Cole Administration Building

Work Order: 2111198

CASE NARRATIVE

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Analytical Comments for method 8290, Method Blank, Note: Cleanup standard recovery bias high. All compounds are ND. Cleanup standard recoveries were within range for the client samples. No corrective action required.

Torrent LABORATORY, INC.

Date/Time Received: 11/17/21, 1:40 pm
Date Reported: 12/02/21

Client Sample ID:	AOC5-S7-0.5	**Lab Sample ID:**	2111198-001A
Project Name/Location:	Cole Administration Building	**Sample Matrix:**	Soil
Project Number:	403668001		
Date/Time Sampled:	11/16/21 / 9:57		
SDG:			

Prep Method:	3546_BNA	**Prep Batch Date/Time:**	11/19/21 10:35:00AM
Prep Batch ID:	1137022	**Prep Analyst:**	AKIZ

Parameters:	Analysis Method	DF	MDL	PQL	Results	Q	Units	Analyzed	Time	By	Analytical Batch
The results shown below are reported using their MDL.											
Phenol-d6 (S)	SW8270C		24 - 113		**0.000**	D	%	11/20/21	22:55	MT	461558
2,4,6-Tribromophenol (S)	SW8270C		19 - 122		**0.000**	D	%	11/20/21	22:55	MT	461558
2-Fluorobiphenyl (S)	SW8270C		45 - 143		**0.000**	D	%	11/20/21	22:55	MT	461558
Nitrobenzene-d5 (S)	SW8270C		23 - 120		**0.000**	D	%	11/20/21	22:55	MT	461558
p-Terphenyl-d14 (S)	SW8270C		18 - 137		**0.000**	D	%	11/20/21	22:55	MT	461558

NOTE: In an effort to minimize matrix interference, the solvent final volume to sample mass ratio had to be increased resulting in elevated reporting limits. The sample was further diluted due to the nature of the extract (dark and viscous).

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.
Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
Units: the unit of measure used to express the reported result - **mg/L** and ***mg/Kg*** (equivalent to PPM - parts per million in **liquid** and ***solid***), **ug/L** and ***ug/Kg*** (equivalent to PPB - parts per billion in **liquid** and ***solid***), **ug/m3**, ***mg/m3***, **ppbv** and ***ppmv*** (all units of measure for reporting concentrations in air), **%** (equivalent to 10000 ppm or 1,000,000 ppb), **ug/Wipe** (concentration found on the surface of a single Wipe usually taken over a 100cm2 surface)

LABORATORY QUALIFIERS:

B - Indicates when the analyte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H- Indicates that the recommended holding time for the analyte or compound has been exceeded
J- Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative
NA - Not Analyzed
N/A - Not Applicable
ND - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R- The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S- Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: Ninyo & Moore

Project Name: Cole Administration Building

Work Order No.: 2111198

Date and Time Received: 11/17/2021 1:40:00PM

Received By: Lorna Imbat

Physically Logged By: Lorna Imbat

Checklist Completed By: Lorna Imbat

Carrier Name: FedEx

Chain of Custody (COC) Information

Chain of custody present?	Yes
Chain of custody signed when relinquished and received?	Yes
Chain of custody agrees with sample labels?	Yes
Custody seals intact on sample bottles?	Not Present

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Not Present
Shipping Container/Cooler In Good Condition?	Yes
Samples in proper container/bottle?	Yes
Samples containers intact?	Yes
Sufficient sample volume for indicated test?	Yes

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes			
Container/Temp Blank temperature in compliance?	Yes	Temperature:	4.0	°C
Water-VOA vials have zero headspace?	Yes			
Water-pH acceptable upon receipt?	Yes			

pH Checked by: Lorna Imbat

pH Adjusted by: n/a

eurofins | Air Toxics

11/30/2021
Mr. Nathan Diem
Ninyo & Moore
2020 Challenger Drive
Suite 103
Alameda CA 94501

Project Name: Cole Administration Building
Project #: 403668001
Workorder #: 2111530A

Dear Mr. Nathan Diem

The following report includes the data for the above referenced project for sample(s) received on 11/18/2021 at Eurofins Air Toxics LLC.

The data and associated QC analyzed by TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics LLC. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Monica Tran at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Monica Tran

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
Ninyo & Moore
Workorder# 2111530A

Seven 1 Liter Summa Canister and one 6 Liter Summa Canister HL samples were received on November 18, 2021. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

Receiving Notes

The number of samples received did not match the information on the Chain of Custody (COC). Sample OA-1 was added to the analytical request.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Ten qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

M - Reported value may be biased due to apparent matrix interferences.

CN - See Case Narrative.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Mr. Nathan Diem
Ninyo & Moore
2020 Challenger Drive
Suite 103
Alameda CA 94501

Project Name: Cole Administration Building
Project #: 403668001
Workorder #: 2111530B

Dear Mr. Nathan Diem

The following report includes the data for the above referenced project for sample(s) received on 11/18/2021 at Eurofins Air Toxics LLC.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics LLC. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Monica Tran at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Monica Tran

Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Ninyo & Moore
Workorder# 2111530B

Seven 1 Liter Summa Canister and one 6 Liter Summa Canister HL samples were received on November 18, 2021. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the EATL modifications.

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A minimum of 5-point calibration curve is performed. Quantitation is based on average Response Factor.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

The number of samples received did not match the information on the Chain of Custody (COC).

Sample OA-1 was added to the analytical request.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

RE: Cole Administration Building

Work Order No.: 2112034 Rev: 1

Dear Nathan Diem:

Torrent Laboratory, Inc. received 1 sample(s) on December 03, 2021 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991 If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

Kathie Evans
Project Manager

December 08, 2021
Date

Date: 12/8/2021

Client: Ninyo & Moore

Project: Cole Administration Building

Work Order: 2112034

CASE NARRATIVE

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Oxygen, CO2 and methane data is pending.

REVISIONS

Report revised to include Helium data.

Rev. 1 (12/10/21)

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.
Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
Units: the unit of measure used to express the reported result - **mg/L** and ***mg/Kg*** (equivalent to PPM - parts per million in **liquid** and ***solid***), **ug/L** and ***ug/Kg*** (equivalent to PPB - parts per billion in **liquid** and ***solid***), **ug/m3**, ***mg/m3***, **ppbv** and ***ppmv*** (all units of measure for reporting concentrations in air), **%** (equivalent to 10000 ppm or 1,000,000 ppb), **ug/Wipe** (concentration found on the surface of a single Wipe usually taken over a 100cm2 surface)

LABORATORY QUALIFIERS:

B - Indicates when the analyte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H- Indicates that the recommended holding time for the analyte or compound has been exceeded
J- Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative
NA - Not Analyzed
N/A - Not Applicable
ND - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R- The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S- Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: Ninyo & Moore

Project Name: Cole Administration Building

Work Order No.: 2112034

Date and Time Received: 12/3/2021 2:30:00PM

Received By: ke

Physically Logged By: Lorna Imbat

Checklist Completed By: Lorna Imbat

Carrier Name: FedEx City

Chain of Custody (COC) Information

Chain of custody present?	Yes
Chain of custody signed when relinquished and received?	Yes
Chain of custody agrees with sample labels?	Yes
Custody seals intact on sample bottles?	Not Present

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Not Present
Shipping Container/Cooler In Good Condition?	Yes
Samples in proper container/bottle?	Yes
Samples containers intact?	Yes
Sufficient sample volume for indicated test?	Yes

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes
Container/Temp Blank temperature in compliance?	Temperature: °C
Water-VOA vials have zero headspace?	No VOA vials submitted
Water-pH acceptable upon receipt?	N/A

RE: Cole Administration Building

Work Order No.: 2112034 Rev: 2

Dear Nathan Diem:

Torrent Laboratory, Inc. received 1 sample(s) on December 03, 2021 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991 If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

Kathie Evans
Project Manager

December 08, 2021
Date

Date: 12/8/2021

Client: Ninyo & Moore

Project: Cole Administration Building

Work Order: 2112034

CASE NARRATIVE

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Oxygen, CO2 and methane data is pending.

REVISIONS

Report revised to include Helium data.

Rev. 1 (12/10/21)

Report revised to include CO2, Oxygen and methane data.

Rev. 2 (12/23/21)

Torrent LABORATORY, INC.

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.
Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
Units: the unit of measure used to express the reported result - **mg/L** and ***mg/Kg*** (equivalent to PPM - parts per million in **liquid** and ***solid***), **ug/L** and ***ug/Kg*** (equivalent to PPB - parts per billion in **liquid** and ***solid***), **ug/m3**, ***mg/m3***, **ppbv** and ***ppmv*** (all units of measure for reporting concentrations in air), **%** (equivalent to 10000 ppm or 1,000,000 ppb), **ug/Wipe** (concentration found on the surface of a single Wipe usually taken over a 100cm2 surface)

LABORATORY QUALIFIERS:

B - Indicates when the analyte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H- Indicates that the recommended holding time for the analyte or compound has been exceeded
J- Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative
NA - Not Analyzed
N/A - Not Applicable
ND - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R- The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S- Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: Ninyo & Moore

Project Name: Cole Administration Building

Work Order No.: 2112034

Date and Time Received: 12/3/2021 2:30:00PM

Received By: ke

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
P	The %RPD between the primary and confirmation column/detector is >40%. The higher value has been reported
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Revision
The report being provided is a revision of the original report sent on 11/18/2021. The report (revision 1) is being revised due to: Report samples to MDL per client request.

Receipt
The samples were received on 10/27/2021 12:54 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 0.3º C.

GC Semi VOA
Method 8081A: The following samples were diluted due to the nature of the sample matrix: (320-80878-A-25-B MS), (320-80878-A-25-C MSD), (320-80878-A-33-C MS) and (320-80878-A-33-D MSD). Because of this dilution, the surrogate spike and matrix spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

Method 8081A: The following samples were diluted due to the nature of the sample matrix : AOC1/AOC2-S5-0.5 (320-80878-6), AOC1-S6-0.5 (320-80878-8), AOC1/AOC7-S8-0.5 (320-80878-10), AOC1/AOC8-S10-0.5 (320-80878-13), AOC2-S12-0.5 (320-80878-17), AOC3/AOC8-S1A-0.5 (320-80878-25), AOC3-S1B-0.5 (320-80878-27), AOC3-S1C-0.5 (320-80878-29), AOC3-S2B-0.5 (320-80878-31) and AOC3-S2C-0.5 (320-80878-33). As such, surrogate recoveries are below the calibration range or are not reported, and elevated reporting limits (RLs) are provided.

Method 8081A: The %RPD between the primary and confirmation column exceeded 40% for 4,4'-DDD and Endrin ketone for the following samples: (320-80878-A-25-B MS) and (320-80878-A-25-C MSD). The primary column values have been reported and qualified in accordance with the laboratory's SOP.

Method 8081A: The %RPD between the primary and confirmation column exceeded 40% for cis-Chlordane and 4,4'-DDE for the following samples: AOC1-S3-0.5 (320-80878-1), AOC1/AOC8-S4-0.5 (320-80878-3) and AOC1/AOC8-S4-0.5DUP (320-80878-4). The primary column values have been reported and qualified in accordance with the laboratory's SOP.

Method 8081A: The DCB Decachlorobiphenyl surrogate recovery for the following samples was outside acceptance limits (low biased) on the primary column: (LCS 320-537878/3-A). The recovery is within acceptance limits on the other column therefore, the data have been reported from confirmation column.

Method 8081A: The following samples were diluted due to the nature of the sample matrix: AOC1-S3-0.5 (320-80878-1), AOC1/AOC8-S4-0.5 (320-80878-3), AOC1/AOC8-S4-0.5DUP (320-80878-4), AOC1/AOC7-S8-2 (320-80878-11), AOC1/AOC7-S8-2DUP (320-80878-12) and AOC1-S11-0.5 (320-80878-15), AOC2-S12-0.5DUP (320-80878-18), AOC2/AOC3-S13/S3I-0.5 (320-80878-21), AOC2-S14-0.5 (320-80878-23), AOC3-S1B-2 (320-80878-28), AOC3-S1C-2 (320-80878-30) and AOC3-S2B-2 (320-80878-32). Elevated reporting limits (RLs) are provided.

Method 8081A: Surrogate recovery for the following samples were outside control limits: AOC1-S3-0.5 (320-80878-1), AOC1/AOC8-S4-0.5 (320-80878-3), AOC1/AOC8-S4-2 (320-80878-5), AOC1/AOC7-S8-2DUP (320-80878-12), AOC1/AOC8-S10-2 (320-80878-14), AOC2-S12-0.5DUP (320-80878-18), AOC2/AOC3-S13/S3I-0.5 (320-80878-21), AOC2-S14-2 (320-80878-24), AOC3/AOC8-S1A-2 (320-80878-26) and AOC3-S2B-2 (320-80878-32). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 320-539070 and analytical batch 320-543265 was outside control limits. Sample non-homogeneity is suspected.

Method 8082: Surrogate recovery for the following samples were outside control limits: AOC1-S3-0.5 (320-80878-1), AOC1/AOC7-S8-0.5 (320-80878-10), AOC1/AOC8-S10-0.5 (320-80878-13), AOC1-S11-0.5 (320-80878-15) and AOC2-S12-0.5 (320-80878-17). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Job ID: 320-80878-1 (Continued)

Laboratory: Eurofins TestAmerica, Sacramento (Continued)

Method 8082: The continuing calibration verification (CCV) associated with batch 320-543551 recovered above the upper control limit for PCB-1254. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: AOC1-S3-0.5 (320-80878-1), AOC1/AOC8-S4-0.5 (320-80878-3), AOC1/AOC8-S4-0.5DUP (320-80878-4), AOC1/AOC2-S5-0.5 (320-80878-6), AOC1-S6-0.5 (320-80878-8), AOC1/AOC7-S8-0.5 (320-80878-10), AOC1/AOC8-S10-0.5 (320-80878-13), AOC1-S11-0.5 (320-80878-15), AOC2-S12-0.5 (320-80878-17), (CCV 320-543551/4), (LCS 320-539050/2-A), (MB 320-539050/1-A), (320-80878-A-17-D MS) and (320-80878-A-17-E MSD).

Method 8082: EPA Method 8082/8082A requires a minimum of 3 peaks to be used for PCB quantitation. Due to the presence of matrix interferences in the following sample(s), only four peaks were used for quantitation.

Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 320-539050 and analytical batch 320-543551 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 320-538884 and analytical batch 320-539464 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep

Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-191082. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Client: Ninyo & Moore
Project/Site: Cole School PEA

Job ID: 320-80878-1

Client Sample ID: AOC1/AOC2-S5-0.5

Date Collected: 10/26/21 10:50
Date Received: 10/27/21 12:54

Lab Sample ID: 320-80878-6

Matrix: Solid

Method: 8081A - Organochlorine Pesticides (GC)
